

Baumer

Passion for Sensors

# Photoelectric sensors.

Reliable object detection and distance measurement  
even on challenging surfaces

Partnership.  
Precise.  
Pioneering.

# Visibly better: Baumer sensors.

The Baumer Group is leading at international level in the development and production of sensors, shaft encoders, measuring instruments as well as components for automatic image processing. As an owner-managed family business, we employ about 2600 workers worldwide in 38 subsidiaries and 19 countries. With marked customer orientation, consistently high quality and vast innovation capability, Baumer develops specific solutions for many industries and applications worldwide.

## Our standards – your benefits.

- Passion coupled with expertise – both have made us a sensor pioneer and technology leader
- Our range of services is hard to beat – we have the right product, developed by our own team, for every task
- Inspiring through innovation – a challenge Baumer employees take on every day
- Reliability, precision and quality – our customers' requirements are what drives us
- Partnership from the start – together with our customers we develop suitable solutions
- Always a step ahead – thanks to our production depth, our flexibility and our delivery reliability
- Available worldwide – Baumer is Baumer everywhere

## Optical sensors – keeping a sharp eye on your plant automation

Not all light barriers and laser distance sensors are the same. With its comprehensive knowledge of the market and extremely high levels of technological expertise in the field of optoelectronic sensors, Baumer stands for products that offer more:

- Exceptional performance in extremely compact designs.
- Detection with high repeat accuracy even for difficult surfaces, colors or lighting conditions
- Robust products for every environmental condition
- Digital intelligence for optimum application solutions, reduced control complexity, smooth data transfer and more efficient plant maintenance.

### Optical sensors from Baumer at a glance

- The right light source - LED, infrared, Baumer PinPoint and excellent laser sensors
- All functional principles - from through beam sensors to *Smart-Reflect*<sup>®</sup> light barriers with no reflectors
- The most reliable object detection and extremely precise distance measurement
- Sector-specific factory automation for robotics, assembly and handling, or packaging
- Ranges of up to 60 meters
- Plastic or stainless steel housing in washdown and hygienic designs
- Simple and adaptable setting, programming and installation for your application

## Glossary

|       |     |
|-------|-----|
| Index | 775 |
|-------|-----|

# Smart & Small – High performance, extremely compact designs

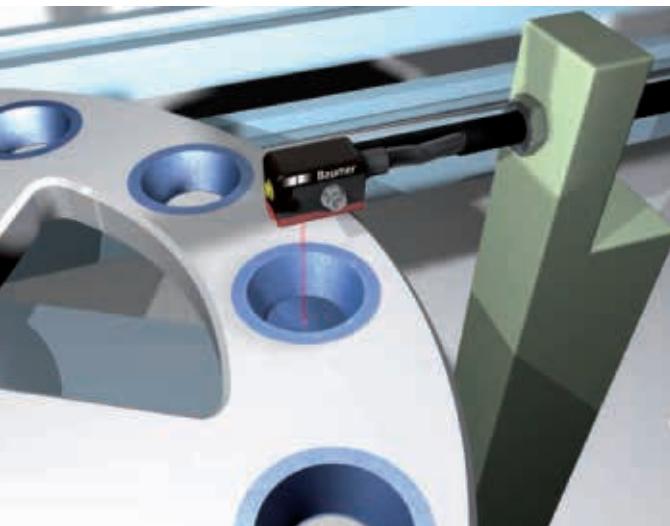

## Optical miniature sensors

- Extensive miniature sensor portfolio for applications where space is at an absolute premium
- High performance in extremely cramped spaces from 4 mm with integral evaluation electronics with a range of up to 8 m
- All sensors, even the smallest, can be easily and accurately adjusted to the specific application requirements
- Sensors with beam diameters of up to 0.1 mm can detect the smallest objects or identify parts with the utmost precision regardless of color or objects in the background

### Distance measuring miniature sensors

- Extremely small laser triangulation distance sensor with integral electronics
- Teachable measuring range of up to 550 mm
- Point laser for extremely small objects or line laser for coarse surfaces
- Highspeed measurements thanks to high measurement rates of 1 kHz

### Leading the global market

- FHDK 04: smallest sensor on the market with real background suppression
- FNxK 07: Smallest line of sensors with an adjustable switching distance
- OHDK 10: laser sensors with background suppression and adjustable sensing distance
- FxDM 08: Miniature sensors for profiled guideways

### Fiber optic sensors and fiber optics

- Detect extremely small objects in narrow and highly inaccessible spaces
- Very small, lightweight sensors for robotics
- Broad range of plastic or glass fiber optics in cubical or cylindrical designs
- Fiber optic sensors in a range of designs and sizes for greater flexibility, wherever they are mounted

# Precise control of fast processes and detection of very small objects

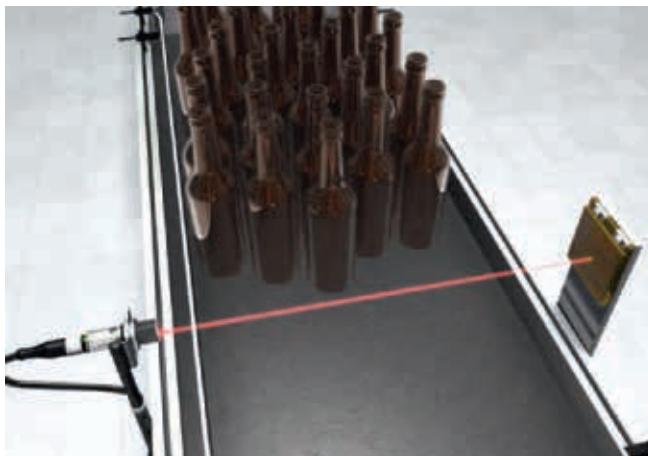

## Laser light barriers and light sensors

### O300 miniature laser sensors with added value

- Precision triggering due to very low jitter of <22 us
- Safe laser class 1
- Reliable detection of irregular or small objects due to line or point beam geometry
- High repeat accuracy
- IO-Link – Industrie 4.0 and IIoT ready

- Extremely high system performance due to very short response times of < 0.1 ms provides rapid, high-precision processing. 0.1 mm laser beam detects extremely small components and differences in position
- Increased product and process quality due to precise detection of small objects from a safe distance and irrespective of their exact position, e.g. on the conveyor belt
- Complete design freedom due to availability in every configuration

### Cylindrical M18 laser sensors

- Rugged M18 metal housing
- Range of up to 55 m

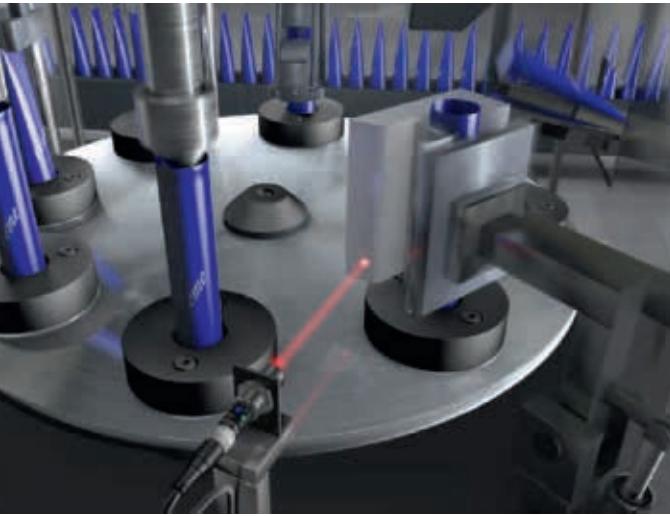

### Laser differential sensors

- Detect extremely small objects < 0.2 mm
- Tolerance analysis
- Comparison of object sizes and positions
- Stage and edge detection
- High insensitivity to color

# Light barriers without reflectors

SmartReflect®

## Cylindrical M18 sensors

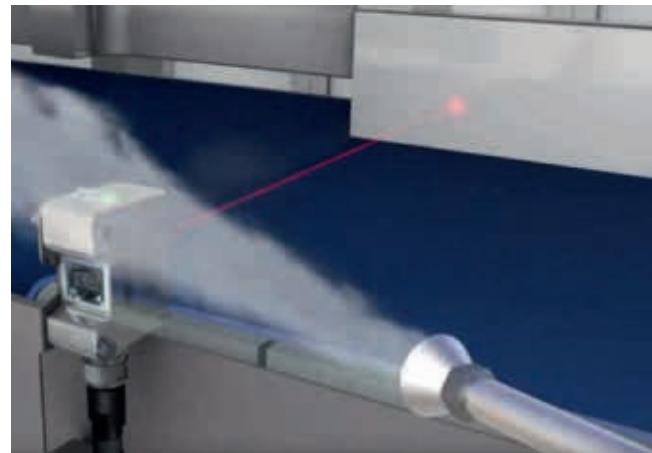

- Rugged M18 metal housing
- Baumer PinPoint LED
- Easy, uncomplicated setup with qTeach
- Range of up to 300 mm

- Extremely high plant availability and process security: Highly reliable object detection thanks to the barrier principle and removal of the reflector as a potential source of errors
- Reduced operating costs: Quick installation as no reflector to fit. No need to replace reflectors due to wear
- Increased productivity due to range of up to 1.9 m or 1 m for transparent objects, and short response times of <0.25 ms. Quick format change, easy sensor replacement and access to additional information via IO-Link

## Transparent detection without reflectors

- Reliable detection of bowls, PET bottles and foils
- Short response time of < 0.25 ms
- IO link – Industrie 4.0 and IIoT ready
- Range of up to 1000 mm

## Stainless steel sensors for demanding environments

- Robust stainless steel housing
- EHEDG-certified, FDA-compliant, Ecolab-tested
- IP 69K and Ecolab-tested
- Long-term seal thanks to proTect+
- Range of up to 1000 mm

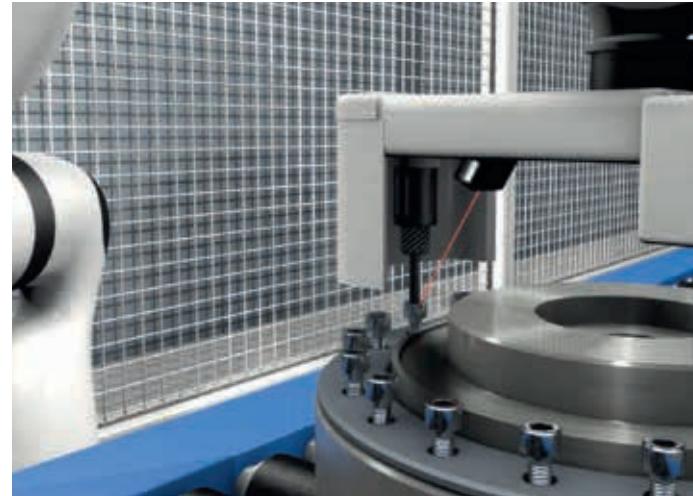

# Measure distance, spacing and position even on challenging surfaces

## Optical distance sensors

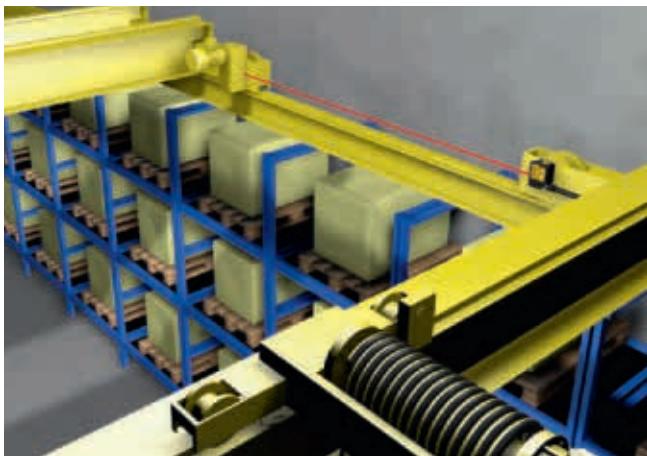

### Miniature sensors

- Extremely small housing with integral microcontroller
- Teachable measuring range of up to 550 mm
- Point laser for extremely small objects or line laser for coarse surfaces
- Safety due to laser class 1 sensors

### High Performance

- Rugged M18 metal housing
- Baumer PinPoint LED
- Easy, uncomplicated setup with qTeach
- Range of up to 300 mm

### Long ranges

- Robust stainless steel housing
- EHEDG-certified, FDA-compliant, Ecolab-tested
- IP 69K and Ecolab-tested
- Long-term seal thanks to proTect+
- Range of up to 1000 mm

- Reliable and efficient processes thanks to a range of beam shapes, accurate measurement to the sub-micrometer scale and long ranges
- Durable, robust solutions thanks to rugged housings made of stainless steel, metal and plastic for different applications
- Simple operation and integration Fast, economical initial start-up thanks to Plug & Play
- Factory-calibrated sensors with measuring values displayed in millimeters

# One function – one sensor

## Smart profile sensors – *PosCon*®

- Compact measuring devices with pre-configured functions for efficient object measurement
- Smart measurement of object heights, edge positions and diameters
- Quick installation with no reflectors
- Easy initial start-up with no external software (plug & measure)
- High accuracy and ambient light immunity

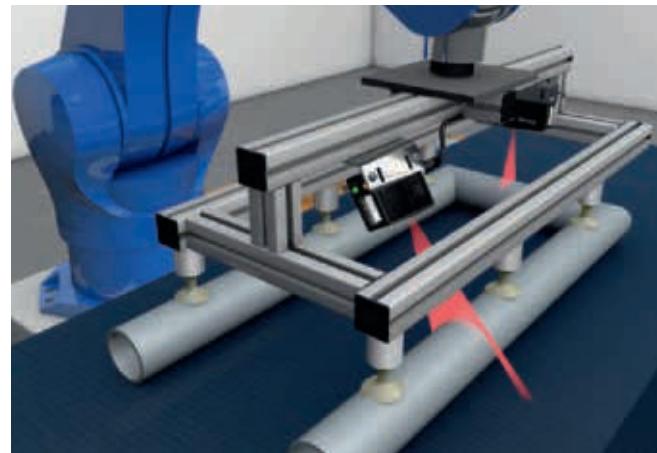

### Easy width measurement – *PosCon OXE7*

- Measurement of object edges, widths and gaps irrespective of out-of-roundness
- Resolution up to 20 µm and measurement rates up to 550
- Reliable measurement even with out-of-round objects
- Adaptable sensor mounting up to ± 30°

### Clever height measurement – *PosCon OXH7*

- Calibrated height measurement, even in rapid processes without precise positioning of the target objects
- High measuring accuracy up to 2 µm even with varying ambient light conditions
- Simple solution for critical check-&-sort applications

### Measuring round objects – *PosCon OXC7*

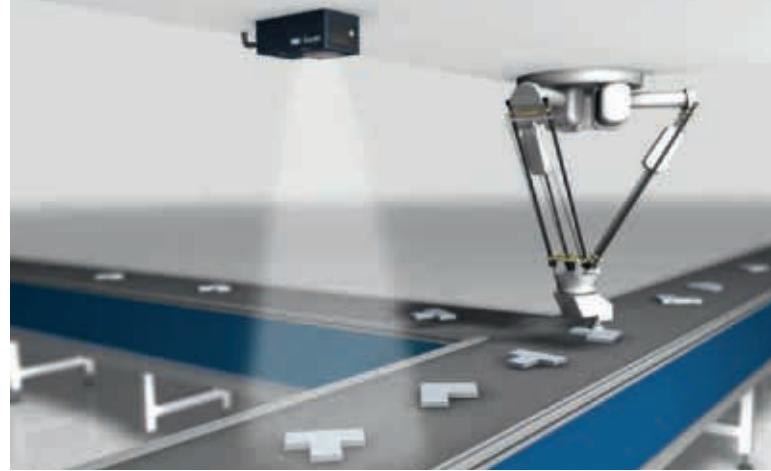

- Smart measurement of circle centers, diameters, top and external positions
- Reliable measurement for accurate positioning tasks and as reference points for inspection tasks
- Simple, adaptable mounting up to ± 30° with no reflectors

# Keeping an eye on your quality

Vision sensors for automation technology – *VeriSens*®

## Highlights:

- Simultaneous, image-based quality control of multiple features with a single sensor
- Easy configuration in a few minutes
- Versatile connection options including industrial Ethernet, digital I/Os
- Configurable web interface with *MultiViewer* function
- High process security due to contour-based image processing
- Image-based reading and evaluation

## XC series: Maximum functionality and versatility

- Check all features (up to 22) with one device, including reading code and text
- Automatic part alignment with FEXLoc®
- C-mount connection for interchangeable lens, lens protection due to modular Tube System (IP 67)
- Fully-integrated VeriFlash® flash controller

## XF series: Extended functionality for complex inspection tasks

- Check all available features (up to 22) with one device, including reading code and text
- Automatic part alignment with FEXLoc®
- Integral lighting and lens
- Variants with IP 69K stainless steel housing in washdown design

## ID series: Code reader and text reader

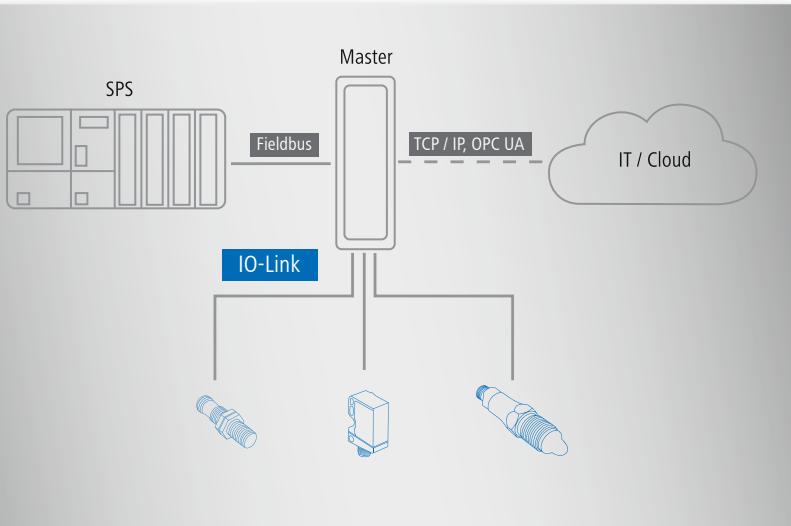

- Image-based checking of 1D/2D codes and plain text (OCR/OCV)
- Simple setup (no font training)
- Integral illumination and lens
- Check static and variable information

# Digitalization starts with the sensor

Sensors accurately capture all sorts of measured values. Valuable additional information is produced by processing the measured values in the sensor. These can be processed through standardized digital communications interfaces such as IO-Link to make significant improvements in business processes.

## Simple integration and maximum flexibility with IO-Link

IO-Link is an international standardized IO technology in accordance with IEC 61131-9. It allows digital, bidirectional point-to-point communication irrespective of the manufacturer. Sensors are connected to the IO-Link Master using standard 3-core plug-in cables. IO-Link is available for a wide range of sensor technologies and can also be integrated into small miniature sensors.

The IO-Link Master bundles several sensors together and provides connection to the control via the relevant fieldbus system. An Ethernet-based connection (using OPC UA) from the master unit also provides direct communication between the sensor and IT systems. The maximum cable length between the sensor and the master unit is 20 m. However, significantly longer connections between the sensor and the control can be achieved by connecting to a fieldbus system via a fieldmaster system. This provides maximum flexibility for the connection solution.

## Additional data thanks to digital sensor connections

Data are the fundamental building blocks of process and product optimization. Access can be gained to valuable, extra data by using IO-Link.

Cyclical data are transmitted in real time. They service the process control in the automation system and can also be transmitted to other IT systems via IO-Link.

Non-cyclical data allow sensors (IO devices) to be configured; analytical and identification data can also be read as required.

### Process data

Measuring distances or switching conditions can be digitally processed and analyzed

Cyclical data

### Analytical data

Data such as signal quality are recorded

Non-cyclical data

### Identification

Data for identifying the sensor such as type of sensor, serial number, application

Cyclical data

### Parameterization

Data for sensor parameterization can be stored and thus quickly multiplied

Non-cyclical data

# The benefits of digitized connections

# OPC UA, Modbus TCP and integral webserver

Simple integration into existing network structures - Ethernet interface, Modbus TCP IP and OPC UA

Baumer uses Ethernet and other technology in its optical measuring systems for data transfer and network connectivity. This provides quick, simple and, thanks to standard components, economical integration of sensors into existing industrial networks. Rapid, complete and error-free transmission of measured data is a further benefit. The measured data themselves and other additional data can be read and analyzed irrespective of their location. The communication protocols which are currently available are Modbus TCP/IP and OPC UA.

The MODBUS protocol is a very lean protocol which allows process data to be exchanged openly and supports rapid and efficient communication in industrial networks.

OPC UA (Open Platform Communication Unified Architecture) is a modern communications standard for use by any manufacturer which allows sensor data to be exchanged beyond the automation system. This facilitates, for example, the use of information from different systems without significant programming effort and thus optimization of processes.

Tailor-made measurement solutions -  
The Baumer web interface for simple configuration and operation

## Simple solutions even for complex measuring tasks

Both simple and complex measuring tasks can be configured and validated quickly and easily via the intuitive Baumer web interface. For complex measurement tasks, extended functionalities, such as the output of the height profile and the camera image, are available for assessing the measurement. The measurements can be recorded and analyzed over time.

## Storage of parameter sets

Up to three parameter settings can be stored in the sensor. The settings can be displayed quickly and easily.

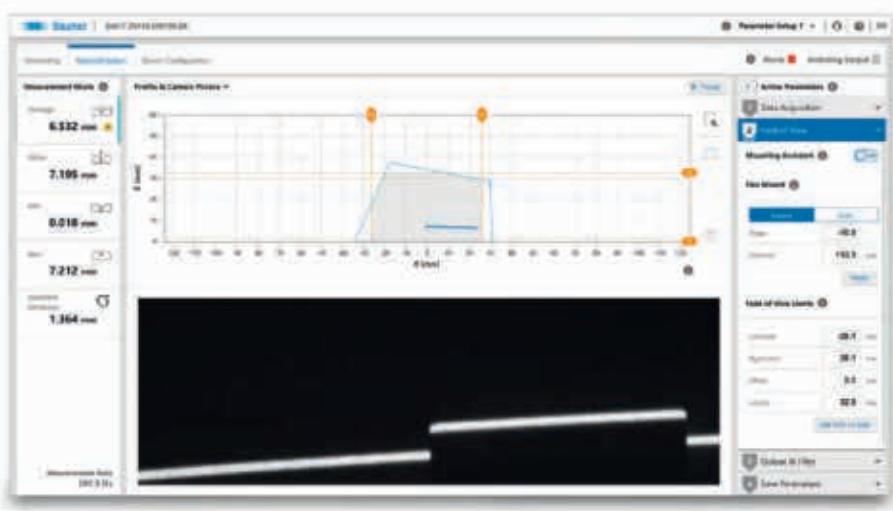

## Process optimization by live visualization and in-depth diagnosis of measured values

### Live visualization and analysis of measured values

The delivered measured values for the selected mode can be monitored and controlled via the web interface. Invalid measured values are displayed immediately. The measured values can be frozen or exported for a more detailed analysis.

### In-depth diagnosis

The unfiltered camera image from the sensor can also be used for a more precise diagnosis of the measuring situation. For example, unwanted reflections can be detected and the alignment can be optimized. The camera image can also be sent directly as a screenshot to Baumer, where expert advice is quickly available.

## General information

With SmartReflect®, Baumer has reinvented the optical light barrier: The reflector as the weak point has been eliminated, and highly reliable object detection is still guaranteed. This reduces your costs tremendously. Since every interruption of the light beam by any object is detected thanks to the SmartReflect® principle, the SmartReflect® light barrier can reliably detect objects irrespective of their shape, color or surface finish.

## Applications

- Presence check of object in processes irrespective of the precise position of the object
- Extremely rapid and precise position detection, even for extremely small objects
- Application in robotics and electronic components
- Automated and configurable object detection, e.g. in format adjustments
- Capture objects, even at large distances
- Reliable counting of objects, even at extremely small distances
- Extremely accurate referencing of movements
- Recognition of different object materials, surfaces and colors, even on transparent, uneven, pitted or rough surfaces
- Monitoring of gradual changes in production processes and automated testing

## Characteristics and advantages

Extremely high unit availability and process security

- Highly reliable object detection thanks to the sensor principle
- Elimination of the reflector as a potential source of error
- No function impairment from dirt accumulation
- Available in robust washdown or hygienic design

Reduction of operating costs

- Quick installation as no reflector to fit
- No need to replace reflectors due to wear
- Expensive reflector cleaning not required

Increase in productivity

- Range up to 1.9 m or 1 m for transparent objects
- High machine performance thanks to short response times of < 0.25 ms
- Quick change of format, easy sensor replacement and access to additional information via IO link

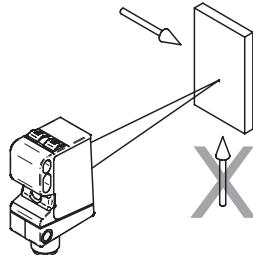

## Technology and operation

Contrary to diffuse or through beam sensors, SmartReflect light barriers feature a closed light beam which is set up between the sensor and machine. The sensor switches when an object interrupts the light beam. The only requirement is the presence of a defined background, e.g. a machine part, within the sensing range of the sensor, which closes the light beam.

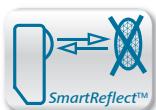

## Mounting and adjustment

The SmartReflect light barrier has to be aligned with a machine part within its sensing range. This machine part is then set using the teach-in.

It should be noted that there is a dead band directly in front of the machine part that is set automatically during teach-in. The dead band is determined by the specification of the sensing range ( $S_a$ ) as a percentage (%) of the background position ( $S_{de}$ ).

It should be noted that an object to be detected must approach the active range of the sensor from the side in order to avoid switching errors.

Sde = 10 ... 45 mm

- compact housing with cable rear side
- sensing distance adjustable via Teach-in
- suppression of mutual interference

**connection diagrams****connectors and mating connectors**

ESG 34AY0200 Connector M12, 4 pin, straight, 2 m, V4A-PP  
 ESW 33AY0200 Connector M12, 4 pin, angular, 2 m, V4A-PP

additional cable connectors and field wireable connectors: see accessories

**Accessories**

HI17-1H Mounting for sensors in hygienic design Ø 17 mm  
 for details: see accessories section

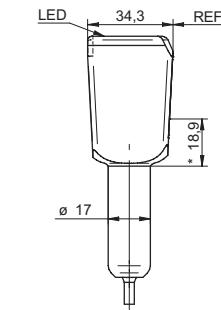

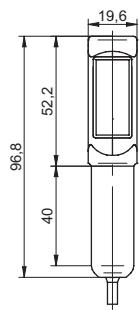

**remarks**

Sensor FDA compliant, EHEDG certified and Ecolab approved  
 IO-Link: output signal, service status, object presence  
 sensitivity adjustable: via Teach-in wire input  
 LSR = Liquid Silicon Rubber

# Retro-reflective sensors

## General information

The emitter and receiver are installed in the same housing. The emitted infrared, red or laser light is returned by a triple reflector or a reflective film to the receiver. The output changes its state when the object breaks the light beam (sensor receives no light).

## Applications

- Stack height monitoring
- Detection of objects located at any position on a conveyor belt
- Detection of transparent objects
- Detection of glossy objects on a conveyor belt
- Retro-reflective laser sensors with single-lens optics allow the precise detection of objects through small openings and the smallest distances between the sensor and the reflector.

## Characteristics and advantages

### Polarizing filter

This filter allows objects to be detected regardless of the texture and color of the surface. Glossy and reflective objects are also reliably detected.

### Single-lens optics

Because the emitted and received beams are on the same axis, the direction of approach of the object is irrelevant, and it is possible to look through small openings. Reflectors can also be used in close-range without signal breakdown.

### Transparent objects

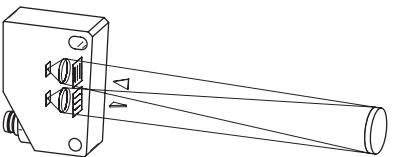

Special versions of retro-reflective sensors can also reliably detect transparent objects such as packaging films, PET bottles and glassware.

### Short response times

Retro-reflective laser sensors with response times of 0,05 ms and focused laser beams correctly detect the smallest, fast-moving objects (0,1 mm in diameter).

## Technology and operation

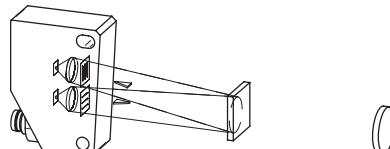

The polarizing filter permits the emitted light to pass in only one polarization plane. The triple reflector depolarizes the light on reflection. A part of the light reflected back to the receiver passes the second polarization filter, offset by 90°, and is detected by the receiver.

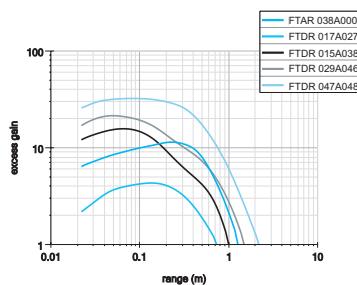

## Technology and operation

A glossy object in the light beam reflects the light without changing its polarization direction. This light cannot pass through the polarization filter in front of the receiver. A glossy object therefore also breaks the light beam.

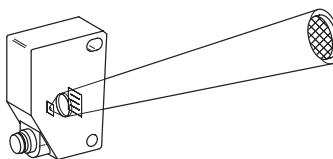

## Mounting and adjustment

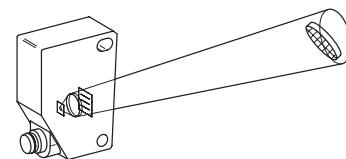

Each sensor has a separate excess gain curve. As the operating reliability depends heavily on the ambient conditions, it must be ensured that the sensor operates with the highest possible excess signal gain.

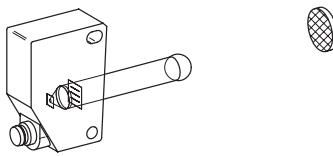

With narrow light beams as used in laser sensors, the size of the light spot on the reflector in relation to the triple structure is crucial factor when it comes to choosing the reflector or the reflective type. A special reflective type or reflector for laser sensors should be used for spot diameters of up to 1.5mm, while the use of reflectors with microstructures is recommended for spot diameters of up to 3 mm. It should also be ensured that the reflective type or reflector is not placed close to the focus.

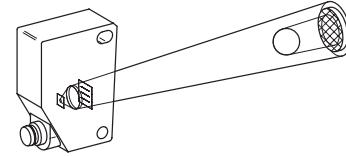

The reflector is aligned and centered.

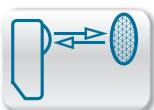

The reflector may not be tilted by more than 15°.

For a correct function, the object must cover the reflector or at least have the size of the beam diameter on the distance.

**Sb = 0,6 m**

- compact housing
- sensing range adjustable via Teach-in
- suppression of mutual interference

# Through beam sensors

## General information

An emitter in a separate housing transmits the light to a separate receiver. The object is detected when it breaks the emitted beam.

## Applications

- Detection of objects at a great distance – through beam sensors have the longest ranges.
- Monitoring of doors and entrances
- Due to the good repeatability throughout the entire range, positioning of objects
- Reliable detection of high-gloss objects such as mirrors, wafers or chrome-plated surfaces

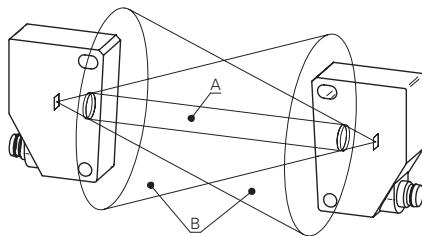

## Characteristics and advantages

- Due to the separated configuration, long ranges with large signal excess gain can be achieved in comparison with equivalent retro-reflective systems. Through beam sensors are therefore most suitable for operation in unfavorable ambient conditions such as dirt, dust and moisture.
- The clearly defined, consistent active zone permits highly constant repeatability throughout the entire sensing distance.
- The switching point is independent of the surface properties of the object.

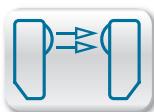

## Technology and operation

The active area (A) of a through beam sensor is equal to the diameter of the lens of the receiver or emitter. The acceptance zone (B) of the emitter and receiver is larger. However, this is only important for adjustment and for operation close to glossy surfaces. With focused through beam laser sensors, the active area is the diameter of the laser beam if this is smaller than the receiver lens or the front opening at the receiver end.

## Mounting and adjustment

The emitter and receiver must be aimed at each other. The narrower the angle of radiation and reception, the more accurately this must be conducted.

**Sb = 2 m**

- compact housing
- sensing range adjustable via Teach-in
- test input

## Introduction

Fork and angle sensors comprise an emitter and a receiver optimally aligned to one another and installed in a torsionally rigid metal housing. This enables highly accurate scanning and positioning of objects, as is required in automatic feeders, vibration conveyors and other applications, while high repeatability is ensured by precise collimator optics. Equipped with a laser light source, fork sensors can even position the very smallest of parts in the micron range. Time-consuming alignment and adjustment usually required for through beam sensors is unnecessary. Compared to through beam sensors, the electric wiring features just one cable connection.

## Typical applications

Thanks to their simple handling and optimally aligned optics, fork and angle sensors are extremely versatile. To enable optimum installation, different fork widths as well as U- and L-shaped versions are available.

### Scanning and positioning

Scanning very small objects down to 50 µm in an automatic feeder

### Stack height monitoring

Monitoring CD sheet stack heights

## Features and benefits

### Easy installation and adjustment

The emitter and receiver are already optimally aligned to one another in a torsionally rigid metal housing.

### Innovative shapes

The special L-shape of the angle sensor enables optimum approach towards the optical axis.

### Fast processes

Switching frequencies of up to 50 kHz allow rotational speed measurements.

### Rugged

Use possible even in harsh ambient conditions thanks to metal housing and protection class IP 67.

## Technology and function

Fork and angle sensors as well as through beam sensors are founded on the same basic principle.

The scratch-resistant, mineral glass collimator optics used in the fork and angle sensors FGUM/ FGLM and OGUM produces a homogeneous, very narrow light beam. This feature gives the sensor its high detection accuracy, which is guaranteed over the entire beam range from all sides.

The largest laser fork sensor can reliably and repeatedly detect a 50 µm object over the entire 120 mm range.

The virtually parallel light beam and the small beam angle of the receiver optics make it possible to install the fork and angle sensors side by side without affecting each other and even produce, for example, small light barriers.

Sensitivity adjustment features a choice of two different adjustment methods – easy manual adjustment of sensitivity using a potentiometer or variable adjustment options by automatic teach-in.

### Potentiometer

Easy sensitivity adjustment thanks to mechanical 270° potentiometer directly on the fork sensor.

### Teach-in

The teach-in function enables rapid and easy commissioning in the field. The teach-in operation can be performed using the integrated teach-in button or the external teach-in cable.

## Mounting and adjustment

The almost parallel light beam and the small beam angle of the receiver optics make it possible to install the sensors side by side without affecting each other and even construct, for example, small light barriers.

Attach the fork and angle sensors so that the object can pass freely through the scanning range. The receiver side should be protected from direct exposure to external light sources.

### Potentiometer adjustment

Sensitivity is highest when the potentiometer is turned fully counterclockwise, enabling the smallest possible parts to be scanned with minimal power of the beam.

When the potentiometer is turned fully clockwise, sensitivity is lowest, so only larger parts are scanned. The power of the beam is highest and the fork/angle sensor has high excess gain to combat dirt.

### Teach-in adjustment

The dynamic teach-in facility enables the sensor to calculate the optimum sensitivity level during operation, resulting in new potential applications.

For example, the smallest objects can be taught in without precise positioning simply by passing the light beam.

To initiate the dynamic teach-in procedure, the yellow teach-in button must be held down for 2 seconds. At least two objects should pass the light beam of the fork sensor during the following 2-4 seconds of the active teach-in phase. The LED indicates the active teach-in phase by flashing rapidly. If the teach-in procedure was completed successfully, this is clearly and visibly indicated by two flashes of the LED.

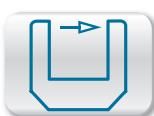

The active teach-in phase can be defined individually using an external teach-in facility. The longer a pulse is applied to the external teach-in cable, the longer the sensor teaches in its surrounding. When the external teach-in facility is employed, the teach-in button can also be automatically disabled.

### Adjustment of light/dark switching

The output functions NO (dark-switching) and NC (light-switching) can be adjusted using a rotary switch. The required switch position is indicated on the type plate.

To prevent accidental switching, the rotary switch is covered by a rubber cap.

Important: always set the switch for the output function fully clockwise or counterclockwise. Intermediate positions lead to undefined output states.

**Sb = 20 mm**

- sensitivity adjustable via potentiometer

## General information

By using the triangulation principle, diffuse sensors with background suppression not only measure the light intensity reflected by the target, but also determine the distance of the object from the sensor. In this way, objects with the minimum size of the light beam located within the adjustable sensing distance can be detected regardless of their color and surface.

The diffuse sensors with background suppression and laser light source were developed specifically for applications in which exact positioning is important. With the precisely focused beam, even very small objects such as the wires of a resistor or threads can be clearly detected or counted.

## Applications

- Detection of boxes, metal and plastic parts lying on a base such as a conveyor belt, table or transport trolley from above
- Detection of bulk materials or other non-transparent materials in a container
- Counting of different-colored objects such as plastic bottles or printed packages
- Reliable presence monitoring of assembly parts, even with objects moving in the background

## Characteristics and advantages

### Adjustable sensing distance

The switching point can be adjusted accurately between the object and the interfering background using a set screw or Teach-in method

### Largely independent of color

The sensing distance remains constant even if the color of the objects changes. Readjustment is therefore unnecessary. Objects changing in the background also have no effect.

### Small spot size

Laser sensors can detect objects with a size of just 0,1 mm. Sensors with pinpoint diodes have a spot of only 2 mm diameter at the focus.

### Red light emitters

Visible red light permits simple adjustment of the sensor to small objects by eye.

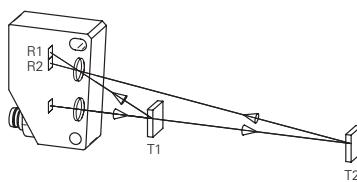

### Short response time

Small, quickly moving objects are reliably detected due to the short response time.

## Technology and operation

The sensors are based on the triangulation principle. Only the angle of the light reflected back from the object determines the distance at which the sensor responds. The amount of reflected light is far less important.

The schematic sketch below shows that receiver R1 receives the light reflected back from the object T1 (acute angle of incidence) and receiver R2 the light reflected back from the background (shallow angle of incidence). The transition from R1 to R2 determines the sensing distance.

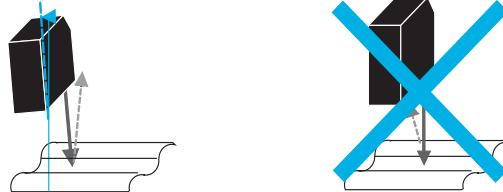

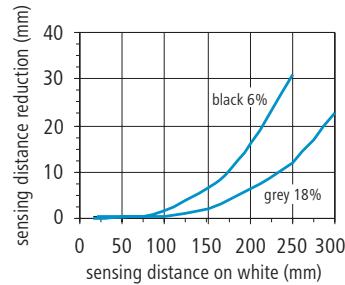

## Mounting and adjustment

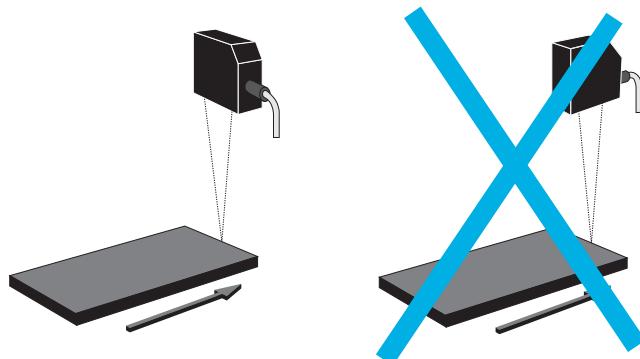

The diffuse sensor must be aimed at the object. The sensing distance must be set to a distance between the target and the background. The background must be located behind the adjusted sensing distance by at least the distance of the sensing distance reduction of the sensor to black.

For diffuse sensors with background suppression, the sensing range diagram is specified for the optimum adjustment. This indicates the sensing range reduction as a function of the sensing range to white for different degrees of remission.

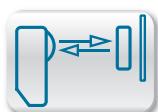

This means the distance by which the sensing distance to black or gray is reduced in comparison with white. When the adjusted sensing range to white is entered on the X axis of the diagram, the reduction of the sensing distance to black or gray can be read off on the Y axis. The sensing distance reduction also indicates the minimum distance a black or gray object must be separated from a white background.

The direct reflection from glossy or reflective objects must not impinge on the receiver. This can be avoided by slightly tilting the sensor.

It should be ensured that the object to be detected approaches the active area of the sensor from the side, which avoids malfunctions caused by deflection of the light beam at edges.

Tw = 50 mm

- compact housing
- small beam diameter
- push-pull output

## sensing distance diagram

## beam characteristics (typically)

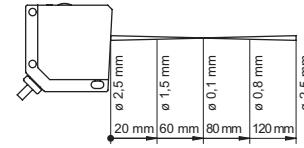

distance to laser focus = 80 mm

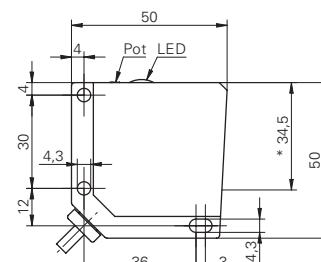

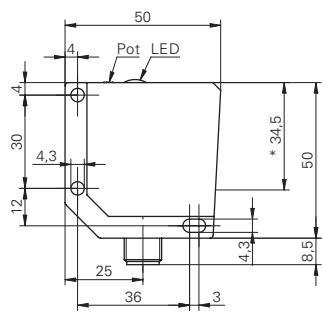

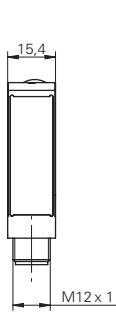

distance to laser focus = 40 mm

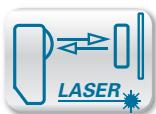

distance to laser focus = 60 mm

## dimension drawings

Tw = 133 mm

- for lateral detection of wafer edges
- very long range
- laser sensor in rugged metal housing

## General information

The emitter and receiver are in the same housing. The emitted infrared, red or laser light is reflected directly by the target back to the sensor. If the target reflects sufficiently well, the received light causes the sensor to switch.

## Applications

- Differentiation and sorting of objects, e.g. by size, degree of reflection etc.
- Counting of objects
- Presence check, e.g. of a paper stack.

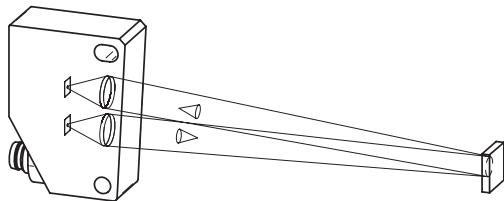

## Characteristics and advantages

- Exploitation of the reflection from the target
- Suitable to discern black from white
- Relatively large active range
- Simple installation (only one sensor)
- Short response time
- The sensing distance depends largely on the reflective properties of the object surface.
- Positioning and monitoring with just one sensor.

## Technology and operation

The light shining on the target is largely diffused and reflected back in all directions. A very small part of this remitted light is observed by the receiver. If the target reflects sufficiently well, the received light causes the sensor to switch.

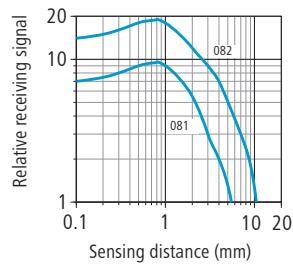

As the sensor operates with the reflection from the materials, the surface properties, color and gloss have a great influence on the switching distance.

## Mounting and adjustment

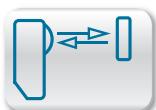

With diffuse sensors operating by the intensity difference principle, the relative receiving signal is specified. This represents the signal level received from a white object as a function of the distance. Using this diagram, the sensing range can be determined for an object which is not white. The correction factor of the respective material is required for this purpose.

### Correction factor

The material and surface properties of the object (representing the reflectivity) influence the switching distance of a diffuse sensor with intensity difference. To determine the corrected switching distance, the following values must therefore be applied to the relative receiving signal (KFs) or in approximation to the distance (KFd).

| Material               | KFs   | KFd   |
|------------------------|-------|-------|
| Kodak test card        | 100 % | 100 % |
| Pale, planed wood      | 80 %  | 90 %  |
| Rough wood             | 20 %  | 45 %  |
| Drawn aluminum         | 25 %  | 50 %  |
| Cardboard, matte black | 7 %   | 26 %  |

Tw = 20 ... 150 mm

- compact housing
- sensitivity adjustable via Teach-in
- suppression of mutual optical interference

| 10103068 | Glass cover series 18                                       |
| 10107250 | Doubling lens series 18 FZAM 18                             |
| 10115913 | Cap nut glass cover and doubling lens for sensors series 18 |

for details: see accessories section

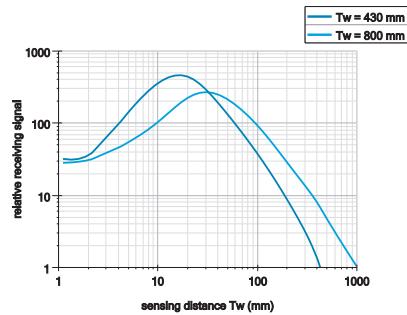

**remarks**

With doubling lens / cap nut, the sensing distance can be doubled.

## General information

With the *LOGIPAL* color detection sensor, you can now use the color as a solution for sorting, quality monitoring and automation in your processes.

## Applications

- Objects can be monitored and sorted by colored marks.
- The correct color of objects can be inspected or the objects can be sorted by their color.

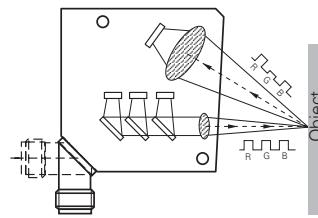

## Characteristics and advantages

- **Simple operation:**  
Four different colors can be programmed with just three buttons.
- **Finest color graduation:**  
One of five tolerance stages can be chosen for each color.
- **Short response time:**  
With a response time of only 0,34 ms, high detection rates can be achieved.
- **Synchronization input:**  
Allows controlled measurement of the color.
- **External Teach-in input:**  
Allows complete remote control of all Teach-in functions by serial data transfer. An RS 232 interface transducer with galvanic isolation is available as an accessory.

## Technology and operation

The sensor operates by the three-stage principle, meaning that it emits the three colors red, green and blue and then measures the color proportions of the three colors reflected by the object.

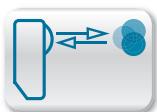

The color of an object is programmed in the Teach-in procedure. If the sensor recognizes this color again during operation, it activates the corresponding output. Optional tolerances permit it to detect large or small differences in color.

## Mounting and adjustment

The use of the color sensor is as simple as for a diffuse sensor. Only the points below must be observed.

- For glossy objects, tilt the sensor to the side by approve. 15 °.
- If you wish to detect very fine differences in color, the sensing distance of 40 mm ha to be adhered.

Tw = 40 mm

- up to 4 colors can be distinguished properly
- spot size 3 x 5 mm
- rugged metal housing

| 10126220                             | Mounting bracket series 22 L design |
| for details: see accessories section |                                     |

**remarks**

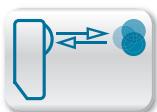

Complete remote control of the sensor is possible using the "Ext. Teach" input. The converter RS 232 is necessary.

## General information

Diffuse contrast sensors can detect finest differences in contrast. Contrasts arise when surfaces bear bright and dark areas (e.g. a dark color mark on a bright primary color), or by structures on a surface (e.g. a weld seam).

## Applications

### - Recognize print marks (FKDK 14)

Print marks (or color marks) are usually dark-colored marks on a light background. The marks differ from the background in brightness and often in color.

### - Detect edges, seams, grooves (laser sensors)

If a surface is observed from an oblique angle, the reflection behavior changes at an indentation, which to the sensor is equivalent to a contrast difference.

## Characteristics and advantages

### - White light sensor

The narrow white light line allows precise detection of color marks

### - Laser sensors

Thanks to the focused beam, even the slightest edge up to 0.1 mm in height can be detected.

### - Fast response time

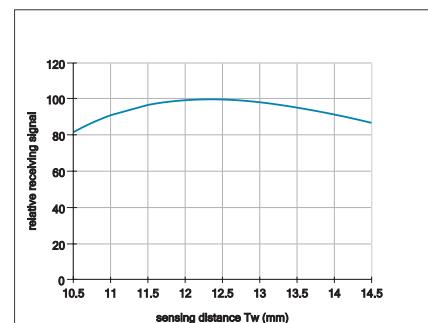

Very short response times up to 50 µs allow "real time" recording of marks and thus increase the process accuracy.

### - Sensor with analog signal

Allows to import desired nominal values and to detect deviations thereof.

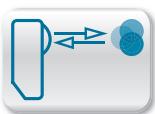

## Technology and operation

Diffuse contrast sensors are based on the intensity difference principle with a clearly defined small light spot. At the ideal operating distance the sensor is optimized so that the finest contrast differences are detected almost independent of small changes in distance. The graph "Relative signal reception" was measured on white paper.

## Mounting and adjustment

The sensor should usually be mounted inclined by 5° to 20° to the object surface, especially when shiny material is scanned. When scanning edges, grooves or indentations, the sensor must be aligned so that the direct reflection is detected when the indentation, groove, or edge enters the light beam.

Tw = 12.5 mm

- hygiene design
- very short response time
- White light

## General information

The range of difference sensors opens new perspectives in the field of sensing. The patented functions provide the user with new, innovative solutions in the detection of objects, monitoring of tolerances or the comparison of object sizes and object positions. With the fine laser beam and the high insensitivity of the sensor to colors, objects are accurately detected. Five different sensors with different functions are available according to the application.

Difference sensors with:

- Step analysis
- Window analysis
- Tolerance analysis
- Min./max. analysis
- 2-point comparisons

## Characteristics and advantages

### Difference evaluation

Distance measuring sensors with integrated logic for distance difference evaluation. Complex evaluation by the connected controller is no longer necessary, saving time and costs.

### Nominal difference teachable

With the standardized Teach-in process of Baumer, the nominal difference can be quickly and easily programmed.

### Switching output

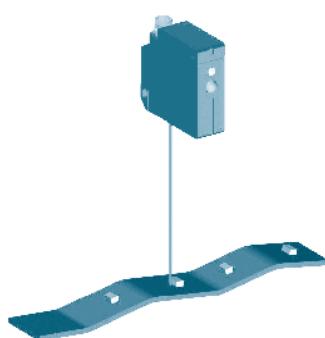

The comparison of the actual and nominal difference is made internally by the sensors and is issued at the switching output as a simply assessed pass/fail signal.

## Applications and functions

### Difference sensors with step analysis

In step analysis, objects are detected by their height difference (stage) and reported in the form of a digital output signal.

The sensor evaluates the positive or negative height difference within a specified time window of max. 5 ms. If the height difference is greater than 50 % of the taught-in value, an impulse of at least 10 ms is issued at the output. When the value is less than 50 %, the sensor switches back to the OFF state. If height differences are smaller than 50 % of the taught value within the time window (e.g. fluctuation of the conveyor belt), the sensor remains in the OFF state.

- The stage / edge from which the objects are detected can be adjusted (minimum object height 0,2 mm)
- Defined output impulse of 10 ms (can also be read by a normal PLC)
- Detection of objects on a fluctuating conveyor belt
- Detection of stages or edges
- Positioning of objects by an edge, regardless of the distance

## Applications and functions

### Difference sensors with min./max. analysis

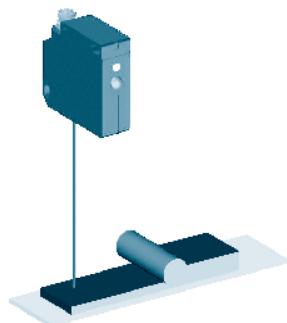

With min./max. analysis, objects can be inspected and monitored according to their scanned contour or shape. The scanning of the objects is activated by an external control signal. At the end of a detection sequence, the measured values are evaluated and the difference between the minimum and maximum values is determined. If the difference exceeds a nominal difference previously taught into the sensor, this is reported in the form of an ON signal. This signal remains active until a new detection sequence is started. When this starts, the output returns to the OFF state. If the difference is smaller than the nominal difference, the output remains in the OFF state.

- Difference is detected regardless of the distance
- Start and stop of the measuring cycle can be determined independently
- Easily evaluated pass/fail signal
- Round true running or knock of wheels / discs can be checked regardless of the distance
- Deformation of plastic parts after cooling can be checked

### Difference sensors with tolerance analysis

The dimensional tolerance of objects can be determined by tolerance analysis. In the continuous detection of object distances, all measured values are checked to determine if it is between the specified maximum and minimum tolerances. In the case of if being between, an ON signal is issued at the output. If the distance remains within the tolerance range, the sensor remains in the OFF state.

- Sensor form of a caliper gauge
- Simple monitoring of a distance with a tolerance range (pass/fail information)
- Tolerance range and nominal distance can be taught in separately
- Material thickness checking after a roller mill
- Material thickness checking for extruders

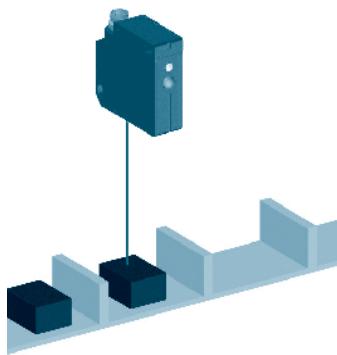

## Applications and functions

### Difference sensors with window analysis

With window analysis, objects can be classified by a specified switching window.

For this purpose, the switching window is specified in a simple Teach-in procedure with upper and lower limits. If an object is outside the defined limits, this is reported at the switching output.

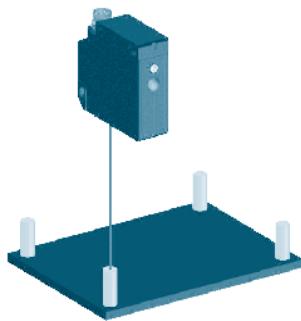

- Foreground and background suppression in a single sensor
- Positions can be taught in separately
- Smallest window 0,45 mm
- Interfering objects in the foreground and background can be suppressed
- Objects can be detected on a segmented conveyor belt

### Difference sensors with 2-point comparison

In a 2-point comparison, two distances detected at two specifically chosen times are measured and compared.

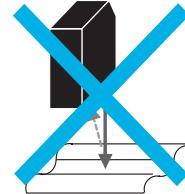

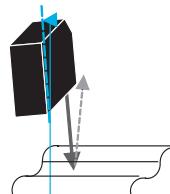

The choice of the time is made using a sync signal. The first distance is measured at the rising flank of the signal and the second distance at the falling flank of the signal. After the second distance was measured, the sensor evaluates the difference between the two distances and compares this with a previously taught-in maximum permissible deviation. If this difference is exceeded, the output switches to the ON state.

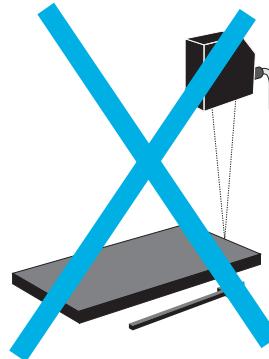

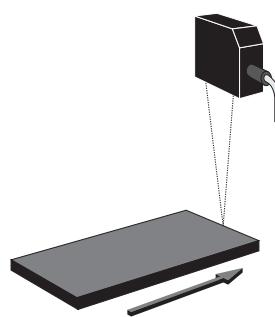

- Object heights can be compared regardless of the distance
- Deviation can be taught in (min. 0,3 mm)
- Measuring time can be determined separately by an external signal
- Checking the pressing depth of pins
- Comparison of the distances/heights of objects with a reference value

### Mounting and adjustment

The direct reflection from glossy or reflective objects must not impinge on the receiver. This can be avoided by slightly tilting the sensor.

For optimum measurement results, the sensor must be installed at right angles to the movement of the object.

**T<sub>w</sub> = 16 ... 120 mm**

- detection of edges
- reference steps adjustable
- min. output pulse 10 ms

**general data**

## General information

Fiber optics are the extended vision of conventional sensors and, due to their miniature construction, can be installed directly in the most difficult ambient conditions. As only light is conveyed, fiber optics are intrinsically safe, which adds to their range of applications.

Plastic fiber optics are characterized primarily by the properties of the employed raw material – the plastic. Advances in the manufacture of plastics permit bending radii of just 1 mm for the optical fibers, which is completely impossible for glass fibers. Fiber materials are now available which are extremely tolerant to bending and thereby make their use in drag chains possible.

## Typical applications

Due to their versatility, optical fibers can be used in the most diverse applications. The small, space-saving sensing heads are very suitable for use in very constricted conditions. It is also possible to monitor whole areas or execute precise positioning by the different arrangements of the fibers.

- Due to the light weight and space-saving construction, optical fibers can be integrated directly in pick & place tools
- Detection, differentiation and positioning of the most diverse objects
- Monitoring of whole areas with fiber optic arrays with linear fiber arrangement
- Use at high, low or constantly fluctuating ambient temperatures
- Detection of levels or leaks, including hazardous liquids
- Detection of transparent media such as glass, wafers or films with focused fiber optic reflective types

## Characteristics and advantages

### Independent of the environment

As only light is conveyed, electromagnetic fields, high or low temperatures have no effect on the functional reliability.

### Space-saving

The smallest sensing heads have a diameter of 1,5 mm and are only 10 mm long. With bending radii of just 1 mm, it is possible to integrate the eye of the sensor even in the most constricted places.

### Precise light spots

Fiber cross-sections of only 0,25 mm generate a fine core beam in fiber optic through beam types, whereas doubling lenses in fiber optic reflective types permit precise light spots of 0,1 mm.

### Application-specific fiber arrangement

The coaxial fiber arrangement permits optimum light distribution over the receiver fibers and thereby makes precise positioning of objects possible. Also, fiber optic arrays with a linear fiber arrangement allow a whole area to be monitored or the detection of randomly conveyed objects.

### Application feedback

Multi-digit displays integrated in the fiber optic sensors permit the stability of the application to be assessed and make fault analyses possible.

### Fast processes

Fiber optic sensors with response times of only 50 microseconds allow the detection of objects even in very fast processes.

## Technology and operation

The technology is based on intensity differences. The fiber optic through beam types detect an object breaking the light beam between the emitter and receiver. The fiber optic reflective types evaluate the amount of light reflected back from an object. The high-resolution analog/digital conversion in the fiber optic sensors permits very slight changes to be evaluated. This is important where the detection of small objects or differentiation of the finest contrasts is demanded.

Fundamentally, the fiber optics form a unit with the corresponding processing units, and the type of fiber optic head is mainly decisive for the detection of objects. The table below is intended to provide aid in understanding the large range of different sensing heads:

## Fiber optic sensors of the ranges FVDK 66 and FVDK 67 – versatile and multifunctional

The generation of multifunction fiber optic sensors is particularly suitable for handling processes, where very fast movements as well as exact positioning or the detection of very small objects are important. A single sensor undertakes the tasks which were formerly performed by many different sensors. The user can choose from 3 to 8 different operating modes from very short response time to high sensitivity to adapt the sensor optimally to his application. Despite the all-in-one concept, the requirement for simple operation is also fulfilled.

### Reduced wiring

With the master/slave version up to 16 sensors can be connected together to one unit (consisting of one master and the appropriate number of slaves). Only the power of the master has to be wired. The slaves are supplied through the side plug. For maximum flexibility in the wiring of the individual sensor signals each slave has a single-core cable. Series 66 and 67 can be combined in any order.

### Application feedback

The application feedback is particularly important during commissioning if consistent detection is to be ensured. The switching point and the relative received signal are indicated simultaneously on the 2x4 digit display of the FVDK 67 range. With this information it can be determined at a glance whether the switching point has been optimally adjusted.

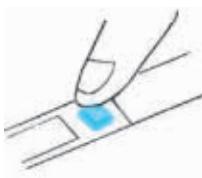

### Long-term stability

In both sensor series measures have been taken to ensure the long-term stability of the switching function. This is done either by compensating the aging of the emitting LED or by repositioning the switching threshold.

## Teach-in or potentiometer? Just simple operation

The fiber optic sensors of the FVDK 12, 22 and 60 ranges are characterized particularly by their simple handling. The sensitivity can be adjusted either with a potentiometer or a Teach-in button. Differently colored LEDs or simple displays provide the adjustment feedback. The sensor ranges differ primarily in their speed, sensitivity, hysteresis functions and supplementary functions such as timers, external Teach-in or logical output gates. However, all have the same thing in common: regardless of where the sensor is installed, the adjustment can be made practically without the need for operating instructions.

### Type FVDK 12

- Integrated, dynamic Teach-in allows the most reliable detection of moving objects or small parts for which it is difficult to find an exact Teach-in position
- High-speed version with a response time of only 50 µs
- Integrated alarm output warns in advance of excessive soiling
- Protection class IP 65

### Type FVDK 22

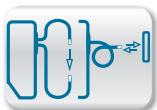

- Two sensors in one housing reduces the necessary wiring
- The two integrated sensors do not interfere with each other
- It is possible to link the two outputs logically
- Version with external Teach-in from the controller

## Teach-in or potentiometer? Just simple operation

### Type FVDK 10

- Smallest fiber optic sensor
- Easy and quick sensitivity adjustment with potentiometer
- Protection against optical interference between up to 3 optical fibers

**S<sub>b</sub> = 160 mm**  
**T<sub>w</sub> = 45 mm**

- sensitivity adjustable via potentiometer
- suppression of mutual optical interference

Three curves are shown for core diameters of 0.5 mm, 1 mm, and 1.5 mm. The 0.5 mm curve peaks at approximately 150 at 5 mm and then decreases. The 1 mm curve peaks at approximately 100 at 10 mm and then decreases. The 1.5 mm curve peaks at approximately 50 at 20 mm and then decreases. |

## General information

In contrast to plastic fiber optics, glass fiber optics contain hundreds of individual fibers. Each one conveys a part of the emitted light. Depending on the arrangement of the individual fibers, a homogenous light spot or a line can be produced. Also, glass is a high-quality, durable material, which guarantees a long and constant service life. This is only one of the reasons that glass optical fibers are used in the telecommunications industry. The high heat resistance also allows fields of application which are difficult or completely impossible with other sensors.

## Typical applications

The wide range of sheath materials and sensing heads make it possible for you to adapt the sensors optimally to your machine concept. A way can always be found to fasten the small fiber optic heads. Due to the different available lengths, the fiber optic sensor can be placed individually at an optimum point.

- Metal-sheathed optical fibers can also be used under harsh conditions
- Detection, differentiation and positioning of different objects
- Monitoring of areas using fiber optic arrays with linear fiber arrangement
- Use at high, low or constantly fluctuating ambient temperatures
- Ranges of up to 1,4 m with fiber optic through beam types

## Characteristics and advantages

### Independent of the environment

As only light is conveyed, electromagnetic fields or high/low temperatures have no effect on the functional reliability.

(plastic-sheathed: -25 ... +70 °C)

(metal-sheathed: -25 ... +250 °C)

### Rugged

Metal-sheathed optical fibers are protected against mechanical effects (chips etc). All fiber optic sensors are fitted with a rugged metal housing.

### Stable operation

High-quality glass fibers ensure stable operation for a long period. All fiber optic sensors are equipped with high-power infrared light sources, which provide sufficient excess gain even with a certain degree of soiling.

### Area monitoring

Fiber optic arrays with a linear fiber arrangement permit an area to be monitored or the detection of objects which are not precisely conveyed.

### Optimum installation

Apart from the common threaded types, fiber optic sensors with smooth sleeves or side light exit are available.

### Fast processes

Fiber optic sensors with response times of only 50 microseconds permit the detection of objects even in very fast processes.

## Technology and operation

By exploiting the so-called total reflection, it is possible to convey light in a medium such as glass without great loss.

### Explanation of total reflection

When light waves reflect on a barrier layer between two media with different optical densities, they do not simply carry on in a straight line. When they penetrate from an optically denser medium (e.g. glass fiber core) into an optically thinner medium (e.g. glass sheath), there is a smaller angle, the critical angle, under which total reflection occurs. The light wave is reflected back and remains in the optically denser medium.

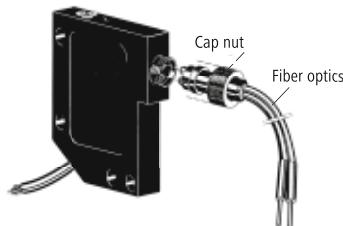

The glass sheath coating the core fiber is decisive for the transmission of light waves almost completely without loss. This ensures an optically consistent density of the sheath and the core and thereby permits a practically constant number of total reflections. This also occurs when the optical fiber is slightly bent. If there would be no core sheath, it would be highly decisive for the total reflection whether the optical fiber is used in an air medium or, for example, water. The critical angle would then change decisively, which could permit an undesired escape of light under certain circumstances.

In the sensing principle, fiber optic solutions are based on intensity differences. With fiber optic through beam types, an object breaking the light beam between the emitter and receiver is detected. With the fiber optic reflective types, the amount of light reflected by an object is evaluated.

For more information, see the section on plastic fiber optics in this chapter.

## Mounting and adjustment

### Fiber optics series 15

The cap nut to fasten the fiber optics is supplied with every order.

If damaged or lost, the cap nut can be ordered under the following number:

Cap nut 10103230

### Fiber optics series 18

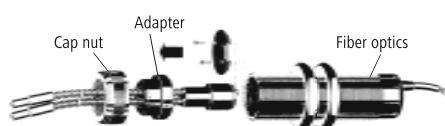

The adjusting plate and cap nut are supplied with every order.

If damaged or lost, they can be ordered under the following part numbers:

Adjusting plate 10101958  
Cap nut 10101480

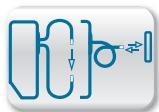

### Fiber optics series 30

The adapter and the cap nut must be ordered as accessories with every order.

Adapter 10102757  
Cap nut 10102801

For installation of the fiber optics, the cover must be removed.

**S<sub>b</sub> = 310 mm**  
**T<sub>w</sub> = 60 mm**

- sensitivity adjustable via potentiometer (axial)
- rugged metal housing
- infrared light source

## General information

With photoelectric level monitoring and leak sensors, liquids can be easily and reliably detected without the need of an electrical connection or mechanical movement between the liquid and the sensor. There are two possible principles of detection: the sensor is in direct contact with the liquid or it is fastened to a hose or stand pipe to detect the level without contact. The available fiber optic versions permit level and leak control in constricted surroundings and even in hazardous zones.

## Typical applications

The chemical resistance of the sensors permits versatile applications:

- Level monitoring of liquids such as
  - acetone
  - alkalis
  - milk
  - acids, e.g. hydrochloric, sulfuric or battery acid
  - mineral oil
  - all non-conductive liquids
- Contact free level detection in (semi) transparent hoses and stand pipes
- Detection of the minimum and maximum levels in trays and tanks
- Leak monitoring of oil trays or lubricant tanks
- Monitoring of leaked liquids in dispensers and other liquid handling systems

## Characteristics and advantages of level monitoring sensors

### Chemical resistance

The sensor housings are made of polysulfonide or stainless steel and are resistant to certain liquids.

### Detectable media

As optical light is used to detect the liquid, various and non-conductive liquids can be detected.

### Simple commissioning

It is unnecessary to adjust sensors with integrated electronics. With fiber optics, the adjustment is made via a fiber optic sensor.

### Hazardous environments

The intrinsically safe fiber optic version with PFA coating can also be used in hazardous environments.

### Detectable media

As optical light is used to detect the liquid, various and non-conductive liquids can be detected. Typically, 1ml of leaked liquid is sufficient to initiate an alarm.

### Failsafe facility

The integrated failsafe facility triggers an alarm on leaks, cable rupture, detachment from the fastening or if the sensor is defective.

### Hazardous environments

The intrinsically safe fiber optic version with PFA coating can also be used in hazardous environments.

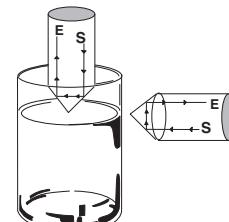

# Level monitoring and leak detecting sensors

## Technology and operation

### Level monitoring and leak sensors in contact with the liquid

The operating principles of both types of sensor are shown in the sketch below. The critical angle for total reflection changes depending on whether the sensor tip is surrounded by water or air. If the sensor tip is surrounded by a liquid, the light beam is refracted by the liquid and the sensor output changes its state. The liquid medium may be electrically conductive, turbid or clear. The same operating principle is employed for the leak sensors. Only the volume of the liquid is different. Typically, as little as 1ml of a liquid can be detected.

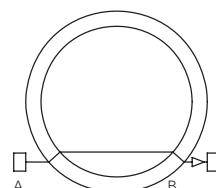

Level not reached

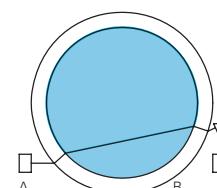

Level reached

### Level monitoring sensors without contact with the liquid

The level monitoring sensors for hose or stand pipe mounting operate by a similar principle. For example, the FFDK 16 also exploits the refractive properties of liquids. In a state without the liquid, the emitted light (A) impinges directly on the receiver (B). If the liquid enters the detection range, a part of the emitted light is refracted, so that less light impinges on the receiver. This change in the light can be assessed by the sensor.

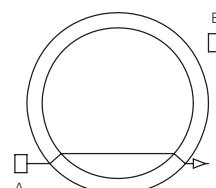

Level not reached

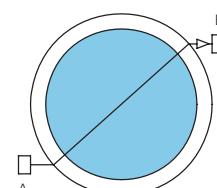

Level reached

With the fiber optic version FSL 500C6Y00, the principle is exactly the opposite. In a state without the liquid, no light impinges on the receiver (B). It is only when liquid enters the detection range of the array that a part of the emitted light (A) is diverted to the receiver (B). This change in the light can be assessed by the receiver. The advantage of the array configuration with a monitoring range of approx. 5 mm is that interference caused by foam and small air bubbles can be suppressed by a powerful fiber optic sensor.

## Mounting and adjustment

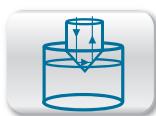

### Level monitoring sensors for hose/stand pipe mounting:

The sensors can very easily be attached to a hose or stand pipe with cable ties. A separate bracket or other holder is unnecessary. No adjustments must be made to the FFDK 16 with integrated electronics. It is only necessary to choose between light and dark switching. With the fiber optic version FSL, the adjustment is made via a fiber optic sensor.

### Leak sensors:

The leak sensors can be screwed directly to the floor or on a base. No adjustments must be made to the sensor FODK 23. With the fiber optic version FOC, the adjustment is made via a fiber optic sensor. The sensors can be very easily released from their holders for cleaning purposes move to beginning of sentence.

- chemical resistance
- up to 10 bar nominal pressure

FFAM 16PTD1002/L

- liquid level sensor for pipe mounting
- pipe diameter from 3 ... 13 mm
- easy setup - no adjustment necessary

## general data

|                                   |                       |
|-----------------------------------|-----------------------|
| type                              | liquid level sensor   |
| light source                      | pulsed infrared diode |
| output indicator                  | LED red               |
| sensitivity adjustment            | no                    |
| wave length                       | 950 nm                |
| max. thickness of the pipe / tube | 1 mm                  |

## electrical data

|                                    |                                 |
|------------------------------------|---------------------------------|
| response time / release time       | < 2 ms                          |
| current consumption max. (no load) | 25 mA                           |

## General information

*PosCon* sensors are based on the principle of 3D light sectioning in which the projected laser line is reflected by the surface and projected onto a two-dimensional optical receiver in a triangulation process. The specially developed multiple lens system ensures the required optical mapping quality.

Different specific figures are thus reliably calculated with the help of clever algorithms and powerful coordinate transformation functions. In the measurement mode in question, the measured result can be compared with configurable limit values, and is available in binary form at the switching output. Or the measured value can be output directly in millimeters on the display or at the interface.

## Applications

### Integrated coordinate transformation

*PosCon* sensors can be positioned laterally at an angle of  $\pm 30^\circ$  above the object. This allows avoidance of disruptive installation obstacles, greatly extending the range of applications. Integrated coordinate transformation corrects the angle error in the sensor. So no additional, time-consuming programming effort is necessary in the control system.

***qTarget® – optical axis aligned by design***  
*qTarget®* enables the optical axis of the *PosCon* sensors to be aligned by design to defined reference points of the housing. This allows correct sensor positioning directly in CAD, making subsequent sensor mounting in the application free of further aiming effort.

### Measurement independent of object positions

An appropriate object can move within the measuring field without having any impact on the measurement. This absence of sensitivity makes a significant contribution to the reliable functioning of the sensor in the application.

### Characteristics and advantages

More freedom in machine construction and easy installation

- Optimum design thanks to optically aligned axis (qTarget)
- Fast sensor alignment thanks to visible laser line and LED indicators
- Any inclined installation position within  $\pm 30^\circ$
- Sensor operation without a reflector

Minimized programming effort for fast implementation

- Predefined measuring functions to measure edge and center positions, gaps and object width
- Only few parameters to optimize your measuring task
- No external software required
- Measured value output in millimeters thanks to calibrated sensor

Process safety ensured by reliable measuring results even under demanding conditions

- Accurate measurements even on very dark objects
- High measuring rates with fast-moving objects
- Immune to ambient light impacts

**Sd = 150 ... 250 mm**

- 0-10 VDC / 4-20 mA (adaptive)
- measuring mode: edges, center, width, gap
- RS 485 interface

**dimension drawing**

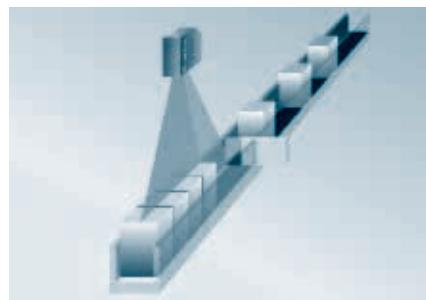

## General information

Line sensors are used to detect object widths and object positions. The position / width is issued as an analog value with high accuracy proportional to the overall measuring area. Although smaller than a deck of playing cards, the sensors contain not only the complete signal conditioning, but also a long-life illumination unit.

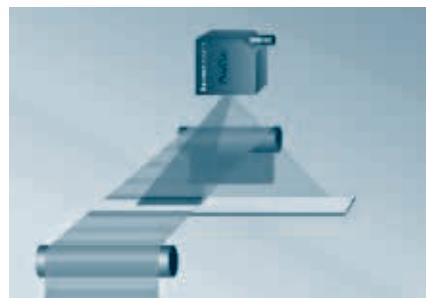

The simple switching version of the *ParCon* also allows the detection of small objects within the measuring area.

## Applications

Edge detection (ZADM 023, *ParCon*)

- Control of textile, plastic or paper edges
- Positioning of objects by the edge
- Level measurement

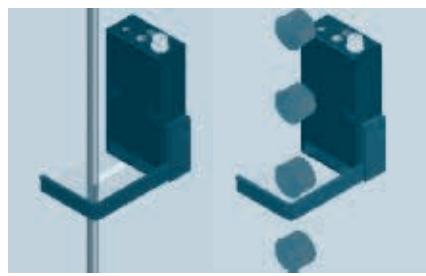

Width measurement (ZADM 023, *ParCon*)

- Width inspection during the production of fabric and rubber bands

Center position (ZADM 023)

- Position measurement by the object center, by which bands or objects of different width can be aligned centrally to each other

Counting and detecting objects (*ParCon*), switching output

- Detection and counting of small objects falling through the measurement area
- Wire and belt break monitoring

## Characteristics and advantages

### *ParCon* line sensor

- The two measuring modes (edge, width, center) can be set by a push of a button.
- Due to the parallel light beams, the vertical movement of fabric webs does not affect the measurement signal.
- The high measuring frequency of 1000 Hz in the analog sensor also allows rapid movements to be detected.
- Due to the high measuring frequency of 4 kHz, even small, rapidly moving parts are reliably detected.

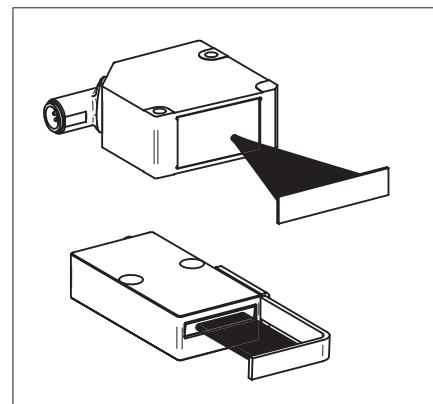

### ZADM 023 line sensor

- The measuring area can be restricted by a simple Teach-in process to suppress interfering objects and areas.
- The three different measuring modes (width, edge, center) can be set simply by a push of a button.
- Two threshold values can be programmed with the Teach-in button and serve as tolerance limits for the switching output.
- All functions available with the buttons can also be operated via an RS 485 interface.
- The position and other information can be read via the interface.
- Measurement is possible on transparent objects and films.

## Technology and operation

With the line sensors, the light of the integrated illumination is reflected by a reflective film (special film) installed opposite the sensor and is received by the diode line. The length of the diode line and the optics determine the measuring area. Due to the narrow diode line, the measuring area is also only a narrow band. If an object obstructs a part of the light, no light falls on the corresponding part of the diode line. The integrated microcontroller processes the shaded areas and the transitions from dark to light and calculates the corresponding analog value according to the measuring mode.

The optics of the ZADM 023 and the *ParCon* are constructed differently. The ZADM 023 has a diverging measuring field. This makes large measuring areas of up to 800 mm possible. The specified measuring area is achieved at the nominal distance. It becomes larger or smaller proportionally with the distance. This causes an object to appear larger or smaller according to the distance. The *ParCon* has a parallel measuring field, making an object appear equal in size in the entire measuring area.

## Mounting and adjustment

The reflective tape specified in the documentation must be used for the ZADM 023 and *ParCon*.

If the reflective tape is protected against abrasion by a Plexiglas or glass sheet, this must be tilted 7° to the sensor to ensure that the direct reflection does not reflect to the receiver. The reflective tape for the *ParCon* is covered by a protective film. If highly reflective objects are measured, it is conceivable that a direct reflection will occur just as strong as the light from the reflective film. In this case, measuring errors can occur. This can be prevented by tilting the sensor away from the object.

## measuring field size = 350 mm

- Teach-in measuring range
- measuring mode: edges, center, width
- RS 485 interface

### general data

## General information

The sensors in the **SCATEC** range were developed specifically for non-contact counting of overlapped paper sheets and newspapers. Other flat objects conveyed in a lap stream or individually can also be counted. If such an object moves through the laser beam, the sensor replies with an electrical impulse with a fixed time period. The patented optical principle permits objects to be detected regardless of their color and surface; matte black objects are counted just as accurately as white glossy ones.

## Characteristics and advantages

### - Counts regardless of the motion of product direction

The copies are counted when an edge facing the laser beam moves through the beam, whether the direction of product motion is forwards or backwards

### - Visible laser beam

The red laser line is easily visible on the object and permits simple alignment.

### - Color insensitivity

The integrated laser controller makes the **SCATEC** extremely insensitive to different surfaces of the object.

### - No blind region

Large counted objects can even touch the sensor without causing counting errors.

### - Sensitivity adjustment

Depending on the model, the sensitivity can be adjusted with a DIP switch, on the control panel or via the interface.

### - Edge indicator

Yellow LED: light is on as long as an edge is in the laser beam.

## Characteristics and advantages

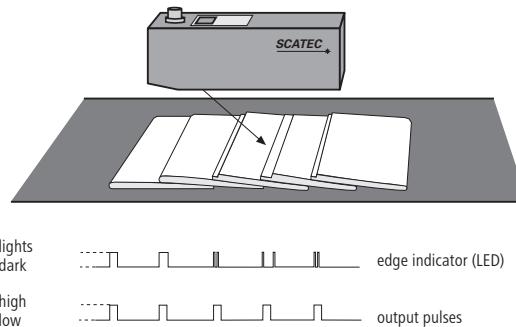

### Multiple pulse suppression

Particularly with thick copies (newspapers, folded cardboard boxes etc.) or with a small prefold, multiple pulses which can occur at the edge can be suppressed by this function. Error pulse suppression operates by preventing further pulses from being emitted when an output pulse is active or during an idle time. The following programs guarantee optimum adjustment to all counting problems:

Fixed idle time: adjustable in milliseconds

Dynamic dead time: the microcontroller constantly monitors the pulse sequence and eliminates multiple pulses even if the conveying speed varies by dynamically adjusting the dead time to the pulse sequence.

Synchronization to the machine cycle: the **SCATEC** can be synchronized to the machine cycle (e.g. by an encoder) via a synchronization input. The dead time then corresponds to a defined distance which is absolutely independent of the conveying speed.

### - No counting errors when the lap stream is interrupted

The **SCATEC** detects only the leading edge of an object. It does not detect trailing edges which become visible when the lap stream is interrupted. Projecting trailing edges can be suppressed by direct gap detection or by delaying the output pulse (**SCATEC-10** or **SCATEC-15**). An integrated retro-reflective sensor allows accurate detection of gaps in the lap stream. This can additionally increase the counting accuracy.

### - Programming and diagnostic software

With the programming software **ScaDiag**, all functions and parameters can be simply adjusted on a PC. Furthermore, measurement sequences can be recorded and stored for diagnosis and troubleshooting.

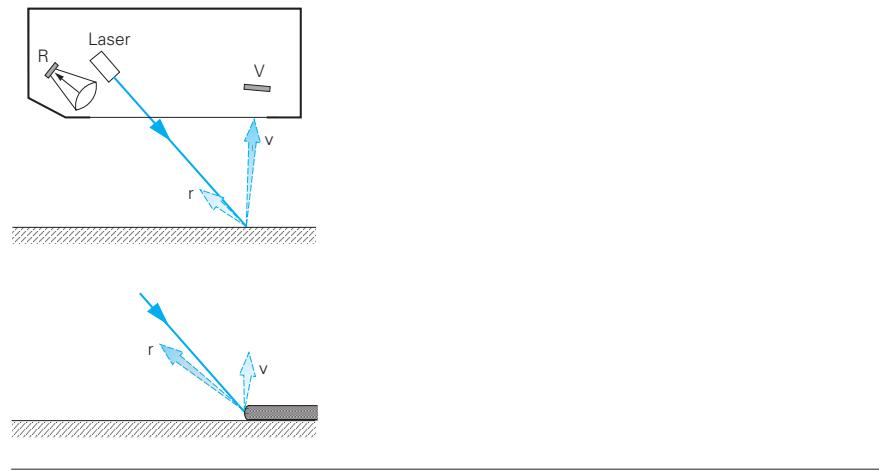

## Technology and operation

Stated simply, the **SCATEC** consists of a laser light source and two photodetectors. The beam is aimed diagonally at the objects to be detected.

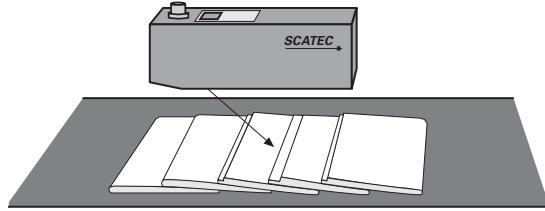

The photodetector **R** is located close to the laser light source and photodetector **V** is a little further away. The sensor determines the ratio between signal **v** (light diffused forwards) and signal **r** (light diffused backwards).

The ration **v/r** differs widely depending on whether the beam strikes a flat surface or an edge. If an edge moves into the laser beam, the direct view from detector **V** to the laser strike point is obstructed, reducing signal **v**, and also the edge increases the backwards diffusion, which causes signal **r** to rise. Both effects make the ratio **v/r** much smaller at an edge than on a flat surface. If the ratio **v/r** falls below a specific threshold, this is interpreted by the sensor as an edge.

Due to the well-focused laser beam, the **SCATEC** detects even the smallest edges. There is no blind region directly beneath the sensor. Large counted objects may even touch the sensor without causing counting errors.

## Mounting and adjustment

- The objects to be counted must have an edge facing the beam.
- The sensor must be installed parallel above the working plane.
- The laser beam should be blocked by a beam stop mounted parallel and just below the bearing surface. We recommend a light, matte object for this purpose (white paper, light and matte metal surface).

**Sd = 0 ... 120 mm**

- up to 3 million copies/hour
- Sensitivity  $\geq 0,15$  mm
- display and integrated counter

#### laser warning

### pin assignments

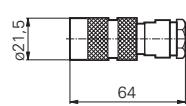

main connector push-pull

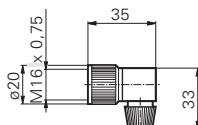

main connector open collector

### connectors

10104236 6 pin (included)

10153094 6 pin (optional)

### connector

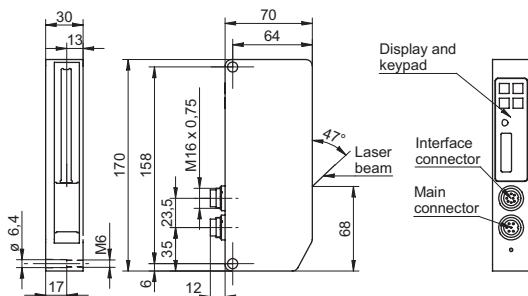

ESG 16DP1000G main cable, length = 10 m, shielded, 6 pin

### reflectors

FTDF 025F025 tape 25 x 25 mm

(included)

### dimension drawing

Sd = 0 ... 120 mm

- Smallest laser copy counter on the market
- counting of up to 600'000 copies/hour
- Sensitivity  $\geq 0,2$  mm

**general data**

## General information

Optical distance sensors by Baumer measure accurately to the micrometer and deliver reliable results even on demanding surfaces. The extremely compact sensors with fully integrated electronics are ready to use quickly and with little effort.

### Reliable and efficient processes

- Laser point, laser line or multi-spot beam shapes for reliable measurement in the sub-micrometer range for demanding surfaces
- Measurements with high repeat accuracy even in the sub-micrometer range
- Precise positioning of objects with a linearity error of  $\pm 0.06\%$
- Smart signal processing in the sensor
- Fast measurements thanks to short measuring cycles

### Long-lasting, robust solutions

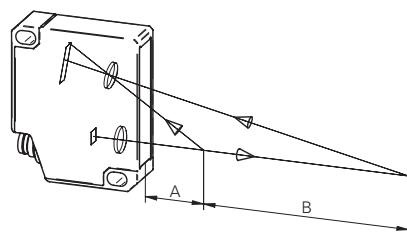

- Robust housings made of stainless steel, metal and plastic for different applications
- High ambient light immunity
- Sensors resistant to vibration and sensors in IP 69K washdown design
- Low temperature drift during fluctuations in ambient temperatures

### Simple operation and integration

- Fast, economical initial start-up thanks to Plug & Play
- Fast and simple adjustment of the measuring range using the teach-in button
- Innovative touch display with a simple operating concept
- Factory-calibrated sensors with measuring values displayed in millimeters

## Technology and operation Triangulation

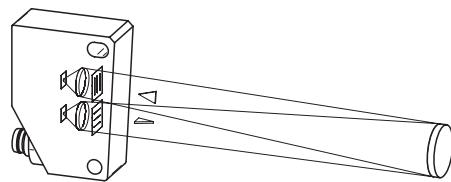

The light beam arrives at the object as a small spot. The sensor's receiver (photodiode array) detects the position of this spot. Depending on the distance, the angle of incidence changes and thus so does the position of the light spot on the receiver. The photodiode array is read by an integral microcontroller. The controller accurately calculates the angle from the light distribution on the photodiode array and then calculates the distance to the object from this. This distance is either transmitted to the serial port or converted into an output current proportional to the distance. The microcontroller guarantees a high degree of linearity and measuring accuracy. The combination of a photodiode array and a microcontroller allows interference from reflections to be suppressed, thus providing reliable data from critical surfaces. The sensor adapts to different colors by adjusting its internal sensitivity, making it almost independent of the color of the object. A digital output is activated if there is no object within the measuring range or if insufficient light is received to detect the object correctly, e.g. if the sensor is dirty. The possible resolution and the accuracy change with the distance. The same distance  $\Delta d$  which causes a significant change in the angle  $\angle 1$  close to the sensor produces a much smaller change in the angle  $\angle 2$  at a greater distance (see drawing). This non-linear behavior is corrected by the microcontroller, so that the output signal retains a linear relationship with the distance.

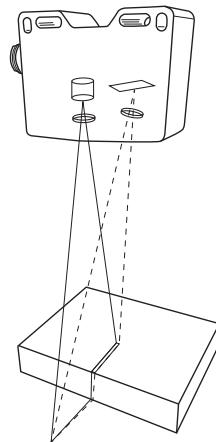

## Time of flight (propagation time measurement)

The propagation time measurement is a process for indirect distance measurement by measuring the amount of time that a signal requires to cover the measuring distance. In practice this means that an emitter sends a signal package which is reflected by the object and by the receiver. In the sensor, the propagation time and/or phase shift is evaluated and converted into a distance. Using this propagation time technology, objects can be detected exactly and reliably at great distances.

## Light section method

The innovative Baumer multi-spot measuring principle is based on the light section method. On the basis of the triangulation principle, the laser beam, which is up to 62 mm wide, is projected onto a receiver matrix, and up to 600 items of distance information are determined. The intelligent evaluation of this distance information takes place directly in the sensor, which then calculates the resulting distance. Thanks to its resolution of up to 2 µm at a measuring frequency of 500 Hz, the sensor provides exceptionally stable and precise measurement results.

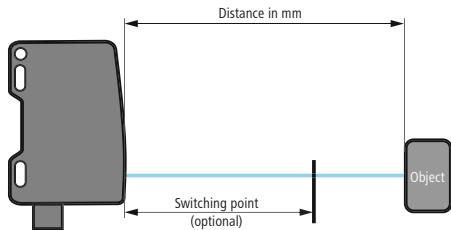

## Measurement functions

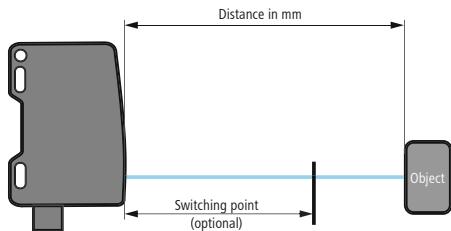

### Distance measurements

In the case of distance measurement, the sensor is ready to use immediately and gives the distance from the sensor to the object. The measured value can, for example, be used for the precise positioning of objects or for controlling a system. A digital output can also be parameterized as an option.

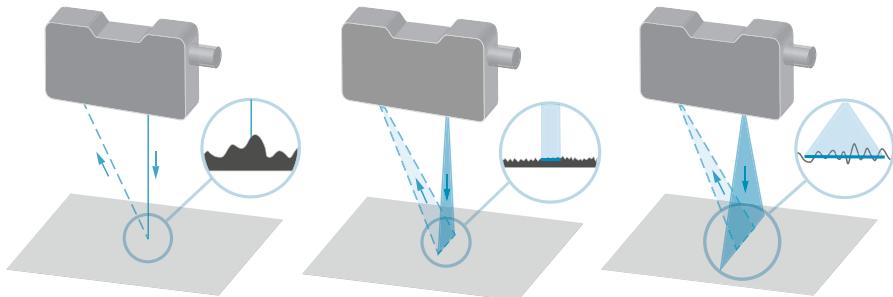

### Tolerance measurements

If, for example, the dimensional accuracy of objects is to be checked, a direct tolerance measurement can be made by teaching-in a reference, thus allowing the deviation from the nominal dimension to be determined directly. Here too, a digital output can be parameterized according-

## Beam shapes

Besides different dimensions and ranges, the beam shape plays a particularly important role. Thanks to continuous further development, Baumer can now offer three different beam forms in its portfolio with the new «multi-spot» measuring principle:

#### Laser point

Accurate measurement of small objects thanks to focused laser spot < 0.4 mm

#### Laser line

Stable measurements on rough surfaces and textured color surfaces thanks to a fine laser line < 10 mm

#### Multi-spot

Stable measurements on inhomogeneously shiny and very rough surfaces from over 600 measurements with an extra-wide laser line < 72 mm

## Optimal focus ranges for OM70 sensors

### Reliable and reproducible measurements

In practice, object surfaces are rarely ideal for optical distance measurement. This often leads to unreliable, unstable measurements. Being the only laser distance sensors on the market, the OM70 sensors therefore offer different focus ranges for the measuring ranges 70, 140, 250, 600 and 1000 mm. This ensures maximum reliability exactly where it is needed in the application.

You are not sure where you want to set the focus range or need the whole measuring range? Then we recommend the basic-type.

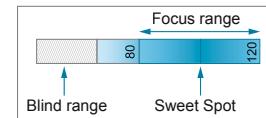

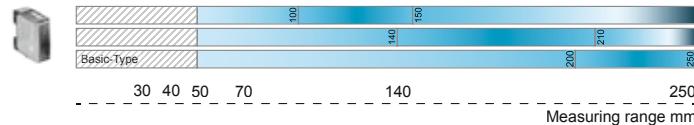

**OM70-P/L0070**

**OM70-P/L0140**

**OM70-P/L0250**

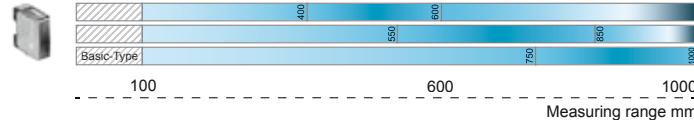

Measuring range mm

**OM70-P/L0600**

**OM70-P/L1000**

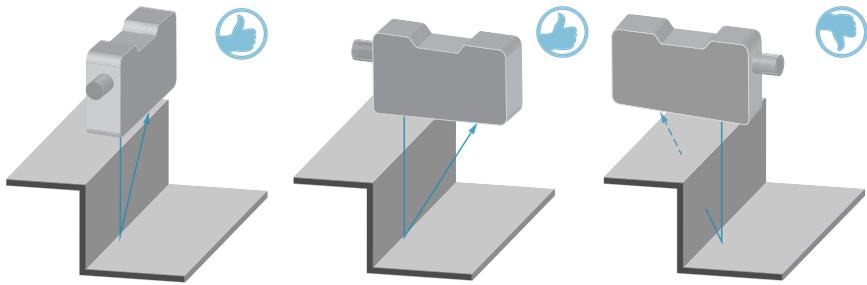

Measuring range mm

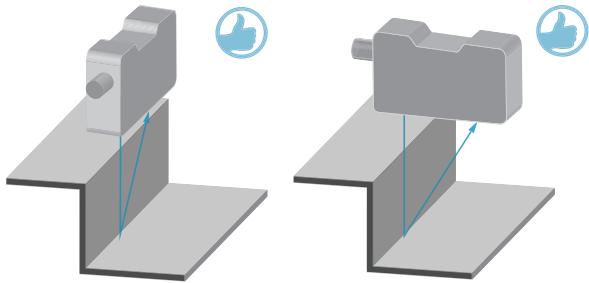

## Mounting and adjustment

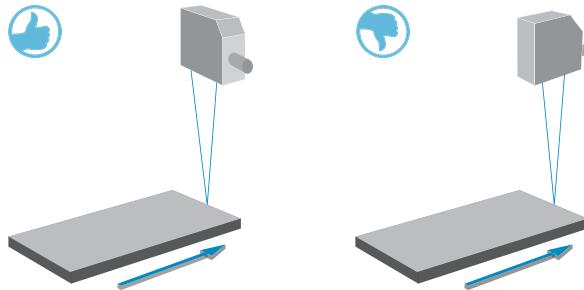

In all distance-measuring sensors, care must be taken to ensure that the laser spot can be directly picked up by the optical system of the receiver and that there are no obstacles in front of the receiver.

With shiny or reflective surfaces, the reflection may not strike the receiver directly. This can be avoided by tilting the sensor slightly. For optimum measurement results, the sensor must be installed perpendicular to the movement of the object.

A simple rule applies for triangulation sensors that the distance between the sensor and the object should be kept as small as possible in each application. The shorter the range, the better (more than proportional) the resolution and accuracy.

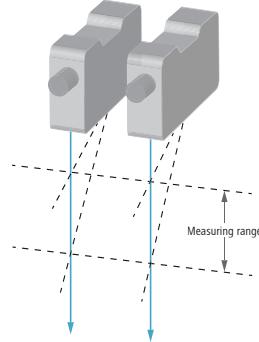

Note on electromagnetic compatibility: Earth the sensor and use a shielded connecting cable.

## Mounting and adjustment

In many applications, several sensors have to be mounted close together. Baumer distance sensors can be arranged side by side without interfering with one another. If mutual interference caused by the installation cannot be avoided, then the sensors can be operated asynchronously using the synchronized input.

## Parameterization

Baumer's optical distance sensors have not only analog but also digital interfaces, through which the sensors are parameterized and directly integrated into the existing production environment.

### Teach-Button / *qTeach*®

Depending on the application, optical distance sensors which only have one analog output can be restricted in their range and thus re-taught or taught in. This may result in greater accuracy, and thus increased process safety can also be achieved. This is done either using a teach-in button or by means of the contactless *qTeach*® function.

### Parameterization by means of the display

An innovative touch display offers the option of setting functions and parameters directly on the display. Depending on the arrangement, this ensures a quick and easy start-up.

- Type of measurement
- Light / dark object
- Filter values
- Analog / digital output

### RS 485

The RS 485 serial interface as a bidirectional bus system allows up to 31 sensors to be connected or parameterized. RS 485 also provides fast data transfer of up to 3 Mbit/s, even over longer distances; measured rates of up to 2.5 kHz can be supported in the application.

### IO-Link

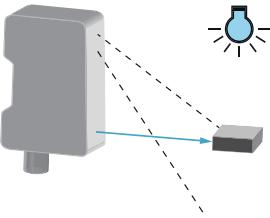

IO-Link allows simple and cost-effective parameterization of optical distance sensors by the PLC. The connection is established by means of a conventional 3-pole M12 cable. Thanks to the standardized interface, IO-Link offers an efficient way to integrate the distance sensors quickly by means of a master at field bus level.

## Special features

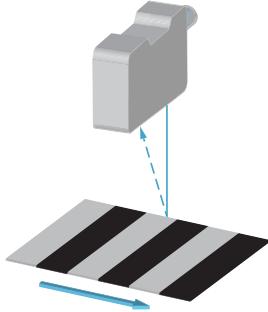

### High ambient light immunity

Powerful algorithms integrated in the sensor make laser distance sensors very insensitive to external light sources. This guarantees reliable, robust operation.

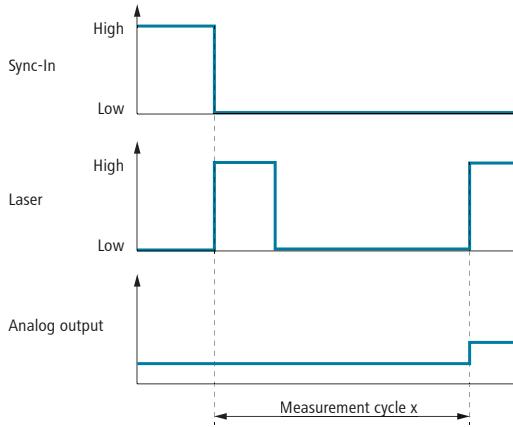

### Automatic exposure control

Optical distance sensors by Baumer automatically adapt to different object colors and brightness levels by varying their transmission intensity and optimizing their exposure time. This they are not affected by the reflectivity of an object. It is also possible to measure objects with a reflectivity of up to 2%.

### Sync-in / triggering

The measurements of several sensors can be synchronized through the sync-in input. For thickness measurements, two sensors can be triggered simultaneously in synchronous mode through the sync input. In asynchronous mode, on the other hand, several sensors that interfere with each other in an application can deliberately be operated one after the other.

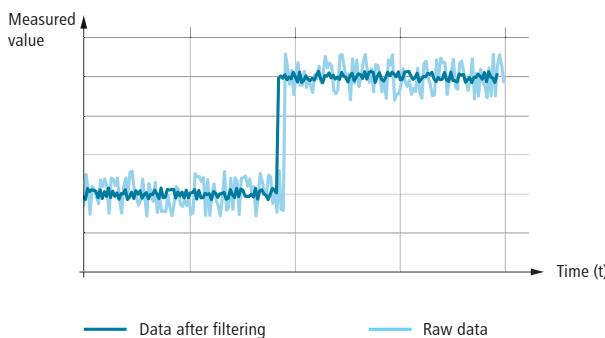

## Special features

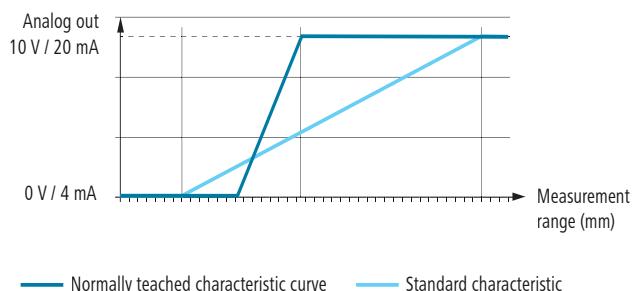

### Programmable filter functions

The noise of the output signal can be reduced by activating filtering, thus increasing the resolution. The filter is used to suppress measurement errors. The output changes only after a defined number of measured values. The measuring frequency is not affected by this filter, but the response time is. The filter function can be parameterized through the selection of predefined precision modes.

### Programmable measuring ranges

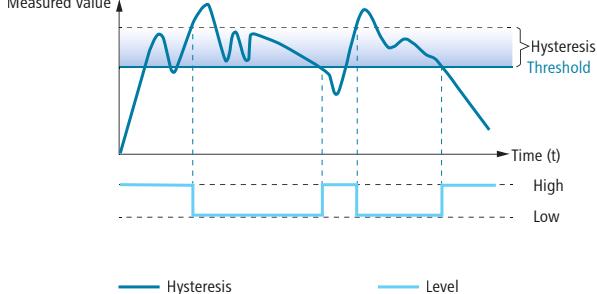

The measuring range can be adjusted by the user within the maximum measuring range with the teach-in button, the teach-in line or through the display. The analog output has its full stroke within this taught-in area and thus higher measuring accuracy. The factory setting is the maximum measuring range.

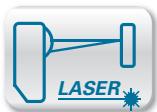

— Normally teached characteristic curve — Standard characteristic

### Configurable switched output

A switched output should switch as soon as a defined measured value exceeds or falls below the set level. For a reliable switching signal, the hysteresis (difference between the switching point and the return switching point) can be parameterized in millimeters in absolute terms. The safe operation of your system is guaranteed, regardless of the position of the object in the field of view.

— Hysteresis — Level

**Sd = 16 ... 120 mm**

- smallest distance measuring sensor
- teachable measuring range Sr > 1 mm
- resolution up to 2 µm

**connection diagrams****connectors and mating connectors**

ESG 32AH0200G Connector M8, 4 pin, straight, 2 m, shielded

ESW 31AH0200G Connector M8, 4 pin, angular, 2 m, shielded

additional cable connectors and field wireable connectors: see accessories

**Accessories**

10150328 Sensofix series 12

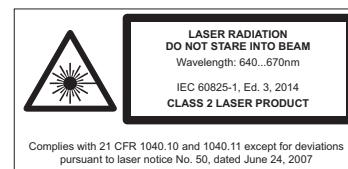

10113873 Mounting bracket series 12 (L design)

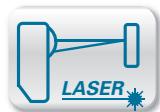

for details: see accessories section

**remarks**

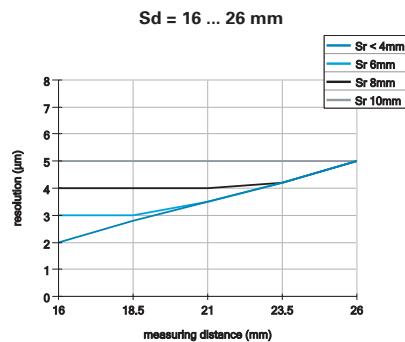

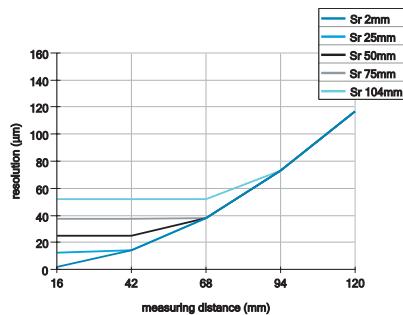

For objects with a reflectivity &lt; 4 %, the response time / release time is increased automatically up to max. 1,5 ms.

Missed measurement up to 30 cycles (30 ms) will be suppressed. During this time the analog output stays on hold.

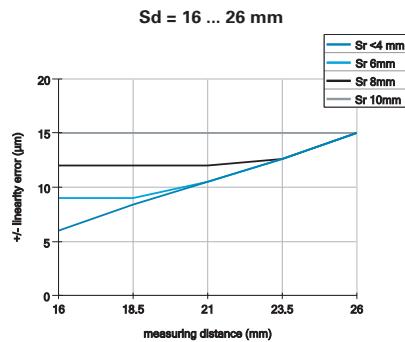

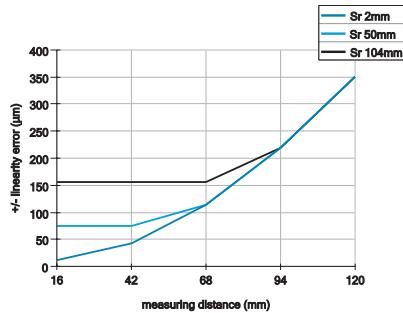

**laser warning**

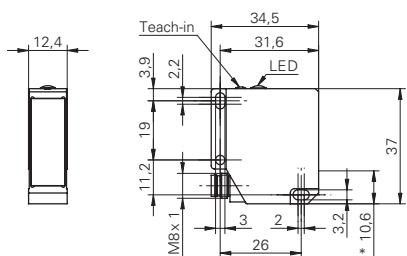

## resolution

 $S_d = 16 \dots 120 \text{ mm}$ 

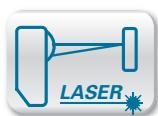

## linearity errors

 $S_d = 16 \dots 120 \text{ mm}$ 

## dimension drawing

\* emitter axis

**Sd = 16 ... 120 mm**

- smallest distance measuring sensor
- teachable measuring range Sr > 1 mm
- resolution up to 2 µm

#### remarks

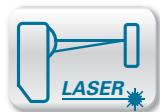

For objects with a reflectivity < 6 %, the response time / release time is increased automatically up to max. 3 ms (OADM 13x6x75/S35A) resp. 5 ms (OADM 13x7x80/S35A).

Missed measurement up to 30 cycles (30 ms) will be suppressed. During this time the analog output stays on hold.

#### connection diagram

#### connectors and mating connectors

ESG 32AH0200G Connector M8, 4 pin, straight, 2 m, shielded

ESW 31AH0200G Connector M8, 4 pin, angular, 2 m, shielded

additional cable connectors and field wireable connectors: see accessories

#### Accessories

10161829 Sensofix series 13

10161695 Mounting bracket for sensors series 13 (L design)

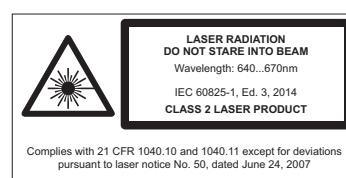

for details: see accessories section

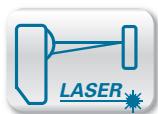

#### remarks

For objects with a reflectivity < 6 %, the response time / release time is increased automatically up to max. 3 ms (OADM 13x6x75/S35A) resp. 5 ms (OADM 13x7x80/S35A).

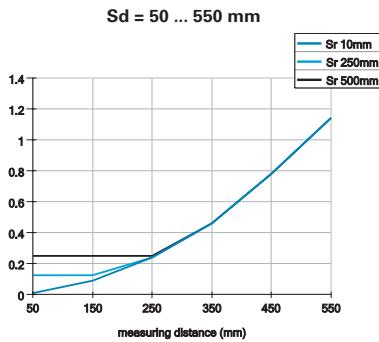

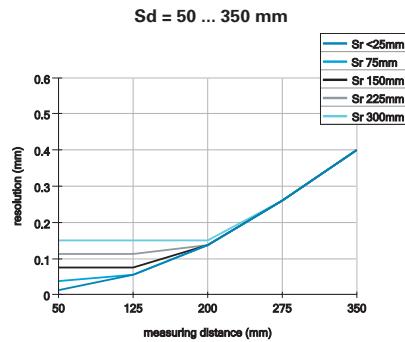

Missed measurement up to 30 cycles (30 ms) will be suppressed. During this time the analog output stays on hold.

#### remarks

For objects with a reflectivity < 7 % (OADM 20I6x80/S14F) or < 15 % (OADM 20I6x81/S14F) the response time/release time is increased automatically up to 2,8 ms.

11010227 Mounting bracket OADM 20

10156878 Protector cap OADM 20

for details: see accessories section

**remarks**

## Fault suppression

If the laser beam is interrupted or if measurement faults occur, the analog outputs and the alarm output remain at their most recent valid value for a max. of 300 ms. Every valid value is immediately passed on to the outputs. If no valid value appears within 300 ms, the analog outputs switch to 4 mA / 0 V and the alarm output goes to HIGH.

## Vibration stability:

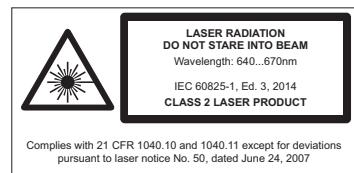

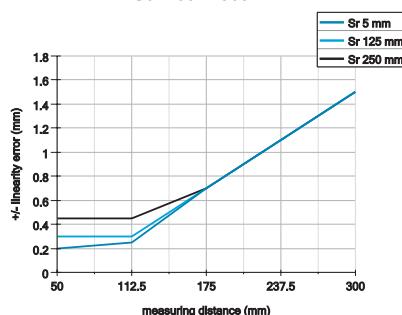

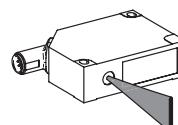

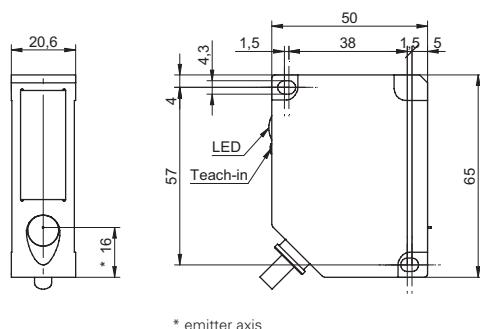

- IEC 60068-2-6 (30 g, 10-2000 Hz, per axis)

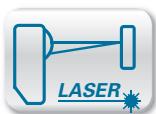

## Random stability:

- IEC 60068-2-64 (0,4 g<sup>2</sup>/Hz, 20-1000 Hz, per axis)

## Bump stability:

- IEC 60068-2-29 (75 g, 6 ms, 4000 pulses per axis and direction)

#### remarks

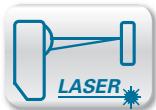

For objects with a reflectivity < 7 % (OADR 20I6x85/S14F) the response time/release time is increased automatically up to 2.8 ms.

## connection diagram

## resolution

$S_d = 50 \dots 300 \text{ mm}$

## connectors and mating connectors

ESG 34FH0200G Connector M12, 8 pin, straight, 2 m, shielded

ESW 33FH0200G Connector M12, 8 pin, angular, 2 m, shielded

ESW 33FH0500G Connector M12, 8 pin, angular, 5 m, shielded

ESW 33FH1000G Connector M12, 8 pin, angular, 10 m, shielded

additional cable connectors and field wireable connectors: see accessories

## Accessories

11120705 Mounting bracket X7 90° for PosCon and OM70,  
incl. accessories

for details: see accessories section

## laser warning

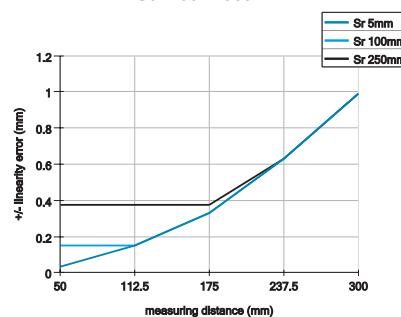

**CLASS 1 LASER  
PRODUCT**

IEC 60825-1/2014

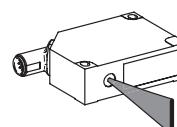

Complies with 21 CFR 1040.10 and 1040.11  
except for deviations pursuant to laser  
notice No. 50, dated June 24, 2007

## linearity error

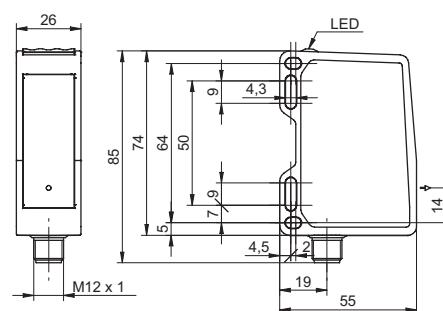

$S_d = 50 \dots 300 \text{ mm}$

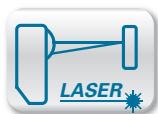

## beam alignment (line)

## dimension drawing

**Sd = 100 ... 1500 mm**

- Distance function
- Very high resolution up to 8 µm
- Output in mm

#### resolution

$S_d = 50 \dots 300 \text{ mm}$

#### connectors and mating connectors

ESG 34FH0200G Connector M12, 8 pin, straight, 2 m, shielded

ESW 33FH0200G Connector M12, 8 pin, angular, 2 m, shielded

ESW 33FH0500G Connector M12, 8 pin, angular, 5 m, shielded

ESW 33FH1000G Connector M12, 8 pin, angular, 10 m, shielded

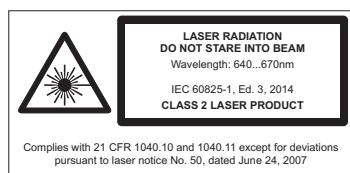

additional cable connectors and field wireable connectors: see accessories

#### Accessories

11120705 Mounting bracket X7 90° for PosCon and OM70,  
incl. accessories

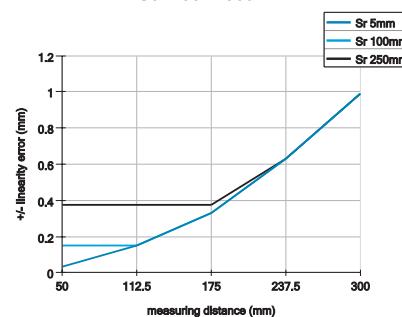

for details: see accessories section

#### laser warning

**CLASS 1 LASER  
PRODUCT**

IEC 60825-1/2014

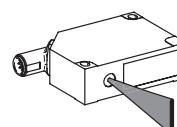

Complies with 21 CFR 1040.10 and 1040.11  
except for deviations pursuant to laser  
notice No. 50, dated June 24, 2007

#### linearity error

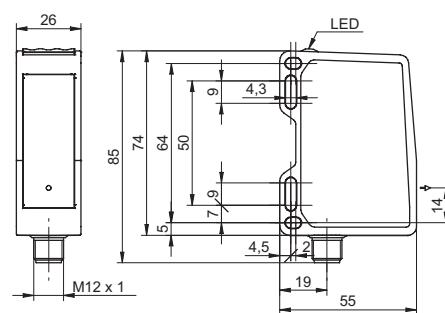

$S_d = 50 \dots 300 \text{ mm}$

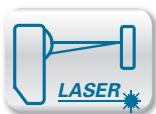

#### beam alignment (line)

#### dimension drawing

**Sd = 100 ... 500 mm**

- Stable measurement values even on coarse and shiny surfaces
- Very high resolution up to 4 µm
- Output in mm

**CLASS 1 LASER PRODUCT**

IEC 60825-1/2014  
Complies with 21 CFR 1040.10 and 1040.11  
except for deviations pursuant to laser  
notice No. 50, dated June 24, 2007

**order reference**

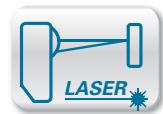

O300.DL-11199078

**connection types**

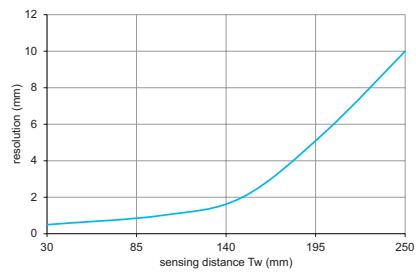

cable 4 pin, 2 m

O300.DL-11199079

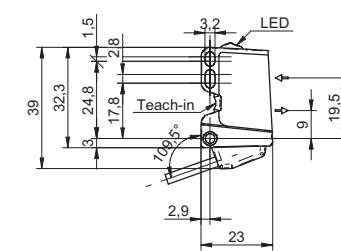

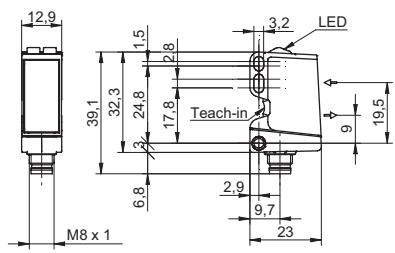

connector M8 4 pin

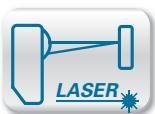

## resolution

## dimension drawings

**Sd = 30 ... 300 mm**

- One inch class
- PinPoint LED
- distance value via IO-Link

# Vision sensors VeriSens®

## Applications

- Presence and completeness check

- Acquisition of part location and correct position

- Reading of numbers and characters

- Reading of barcodes and matrix codes

## Integration – easy and flexible

- Each 5 freely definable digital inputs / outputs
- Encoder interface

- Siemens SIMATIC® S7 function modules
- Process interface

- Visualization of live and defect images
- Backup & Restore function

- Industrial Ethernet integrated (PROFINET / EtherNet/IP®)
- NAT support

## Fields of application

- Quality control
- Food & beverage
- Assembly/Handling
- Packaging industry
- Electronics industry
- Pharmaceutical industry

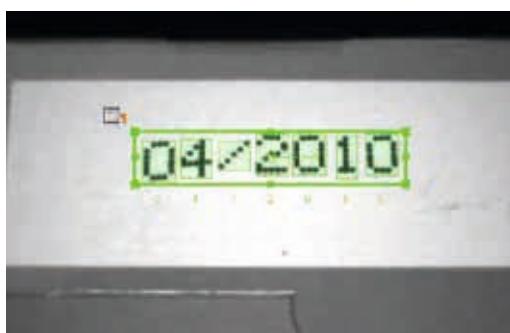

The image-processing VeriSens® vision sensors provide extensive capabilities for a variety of inspection tasks in automation technology. LED lighting, precision optics, a CCD or CMOS camera, processing electronics, and interfaces are integrated in the industrial-suited and compact metal housing (IP 67, IP 69K).

The unified user interface allows intuitive configuration of the vision sensors, even for non-experts in image processing. Visualization or a quick job switching when changing products are also available via a configurable web interface.

## Vision sensor *VeriSens*® for checking and sorting of products

- Completeness and presence control of food packaging

*VeriSens*® ID series

### Reading of text and 1D / 2D codes

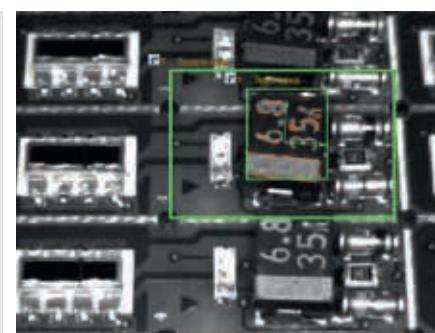

- Multi Reader for text and codes (incl. GS1)
- Reading of text without font training
- Various codes are read simultaneously

*VeriSens*® CS series

### Checking and sorting of products

- Presence and completeness check
- Part recognition and part sorting
- Checking of part geometry

*VeriSens*® XF / XC series

### Powerful for complex inspection tasks

- Largest set of *VeriSens*® feature checks
- Coordinate conversion for Pick & Place
- Result output via process interface

| ESW 33SH0200 | Connector M12, 3 pin, angular, 2 m  |
| ESW 33SH0500 | Connector M12, 3 pin, angular, 5 m  |
| ESW 33SH1000 | Connector M12, 3 pin, angular, 10 m |

**ESW 33G - Connector M12 angular, shielded**

- Connector shielded, screen connected with cap nut
- 4, 5 and 8 pin versions
- Cable coating PUR
- Halogen-free
- Suitable for flexible cable carriers
- UL listed, number E315836

**order reference**

|               |                                               |

| ESW 33AH0200G | Connector M12, 4 pin, angular, 2 m, shielded  |
| ESW 33AH0500G | Connector M12, 4 pin, angular, 5 m, shielded  |
| ESW 33AH1000G | Connector M12, 4 pin, angular, 10 m, shielded |
| ESW 33CH0500G | Connector M12, 5 pin, angular, 5 m, shielded  |
| ESW 33FH0200G | Connector M12, 8 pin, angular, 2 m, shielded  |
| ESW 33FH0500G | Connector M12, 8 pin, angular, 5 m, shielded  |
| ESW 33FH1000G | Connector M12, 8 pin, angular, 10 m, shielded |

**ESW 33F - Connector M12 angular, PVC/V4A**

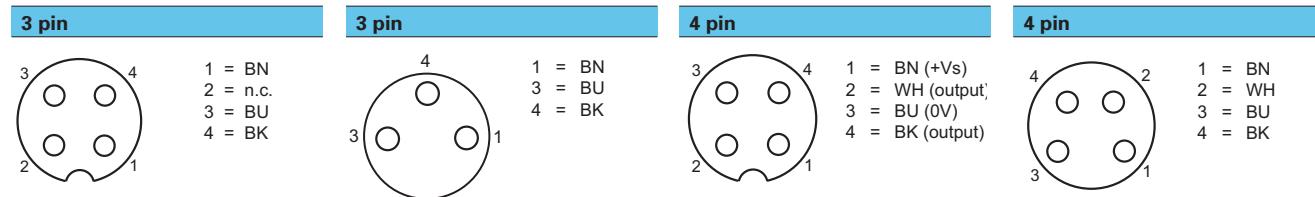

- Connector unshielded
- 4 pin version
- Cable coating PVC
- Cap nut material in stainless steel V4A
- Ecolab certified and FDA conform
- UL listed, number E315836

**order reference**

|              |                                              |

**FTAR 013**

- Fastening method self-adhesive
- Micro structure
- For Retro-reflective sensors

**order reference**

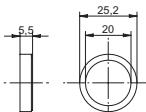

FTAR 013A000 Reflector round Ø 15 mm

**FTAR 014**

- Fastening method self-adhesive
- For Retro-reflective sensors

**order reference**

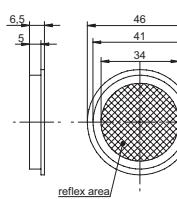

FTAR 014A000 Reflector round Ø 21 mm

**FTAR 020**

- Fastening method self-adhesive
- Micro structure
- For Retro-reflective sensors

**order reference**

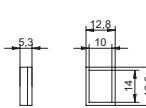

FTAR 020A000 Reflector round Ø 25,2 mm

**FTAR 038**

- Fastening method self-adhesive
- For Retro-reflective sensors

**order reference**

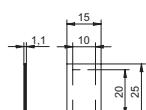

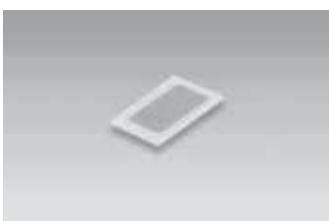

FTAR 038A000 Reflector round Ø 46 mm

**FTDR 010A**

- Fastening method self-adhesive
- For Retro-reflective sensors

**order reference**

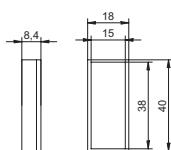

FTDR010A014 Reflector rectangular 16,8 x 12,8 mm

**FTDR 010D**

- Fastening method self-adhesive
- For laser light sensors

**order reference**

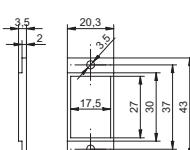

FTDR 010D020 Reflector rectangular 15 x 25 mm

**FTDR 015**

- Fastening method self-adhesive
- For Retro-reflective sensors

**order reference**

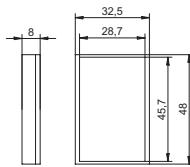

FTDR 015A038 Reflector rectangular 40 x 18 mm

**FTDR 017**

- Fastening method screw mounting
- Micro structure
- For Retro-reflective sensors

**order reference**

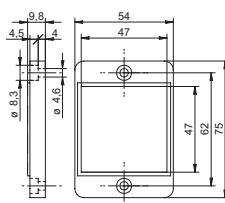

FTDR 017A027 Reflector rectangular 43 x 20,3 mm

**FTDR 029**

- Fastening method self-adhesive
- For Retro-reflective sensors

**order reference**

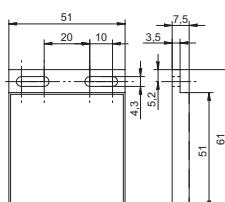

FTDR 029A046 Reflector rectangular 48 x 32,5 mm

**FTDR 047**

- Fastening method screw mounting
- For Retro-reflective sensors

**order reference**

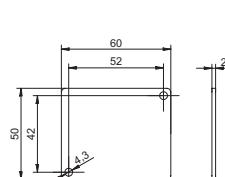

FTDR 047A048 Reflector rectangular 75 x 54 mm

**FTDR 051**

- Detergent resistant reflector
- Ecolab approved
- For Retro-reflective sensors

**order reference**

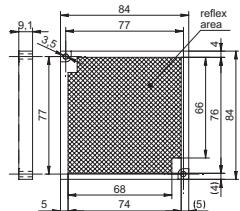

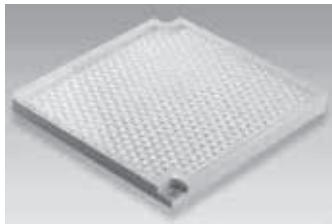

FTDR 051E051 Ecolab approved reflector

**FTDR 050**

- Stainless steel reflector for SmartReflect in washdown design
- Material: Stainless steel V4A

**order reference**

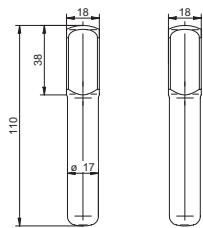

FTDR 050R060 Stainless steel reflector for SmartReflect in washdown design

**FTDR 084**

- Fastening method screw mounting
- For Retro-reflective sensors

**order reference**

FTDR 084A084 Reflector rectangular 84 x 84 mm

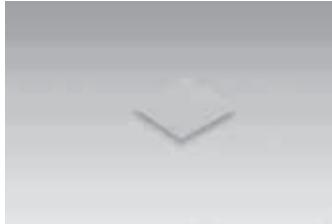

**FTDR 017W**

- Stainless steel reflector for SmartReflect in hygiene design
- EHEDG-certified

Accessory: "mounting for sensors in hygienic design Ø17", order reference HI17-1H

**order reference**

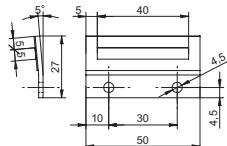

FTDR 017W035 Stainless steel reflector for SmartReflect in hygiene design

**FTDF 020F**

- Fastening method self-adhesive
- For laser light sensors

**order reference**

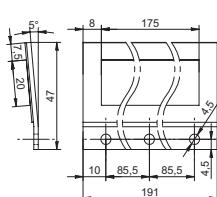

FTDF 020F020 Reflective tape rectangular 20 x 20 mm

**FTDR 005**

- Fastening method screw mounting
- For pocket-size edge sensor *PosCon*

**order reference**

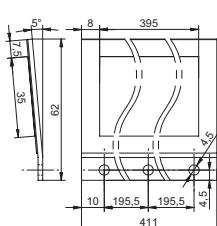

FTDR 005I040 Reflector rectangular 50 x 27 mm

**FTDR 020**

- Fastening method screw mounting
- For pocket-size edge sensor *PosCon*

**order reference**

FTDR 020I175 Reflector rectangular 191 x 47 mm

**FTDR 035**

- Fastening method screw mounting
- For pocket-size edge sensor *PosCon*

**order reference**

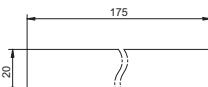

FTDR 035I395 Reflector rectangular 411 x 62 mm

**FTDF 005**

- Fastening method self-adhesive
- For pocket-size edge sensor *PosCon*

**order reference**

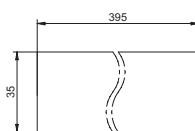

FTDF 005I040 | Reflective tape rectangular 5 x 40 mm

**FTDF 020**

- Fastening method self-adhesive
- For pocket-size edge sensor *PosCon*

**order reference**

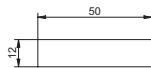

FTDF 020I175 | Reflective tape rectangular 20 x 175 mm

**FTDF 035I**

- Fastening method self-adhesive
- For pocket-size edge sensor *PosCon*

**order reference**

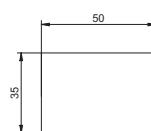

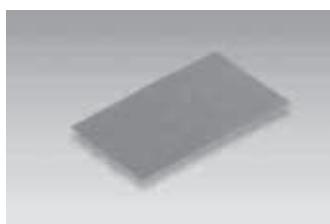

FTDF 035I395 | Reflective tape rectangular 35 x 395 mm

**FTDF 012**

- Fastening method self-adhesive
- For pocket-size edge sensor *ParCon*

**order reference**

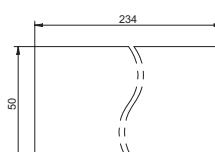

FTDF 012M050 | Reflective tape rectangular 12 x 50 mm

**FTDF 035**

- Fastening method self-adhesive
- For pocket-size edge sensor *ParCon*

**order reference**

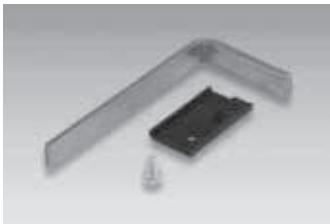

FTDF 035M050 | Reflective tape rectangular 35 x 50 mm

**FTDF 050**

- Fastening method self-adhesive
- For pocket-size edge sensor *ParCon*

**order reference**

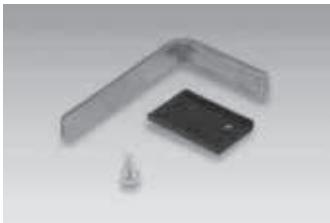

FTDF 050M234 | Reflective tape rectangular 50 x 234 mm

**FTDR 008/01**

- Bracket with reflective tape
- For pocket-size edge sensor *ParCon*

**order reference**

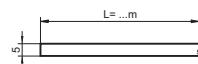

FTDR 008M030/01 Reflector bracket high

**FTDR 008/21**

- Bracket with reflective tape
- For pocket-size edge sensor *ParCon*

**order reference**

FTDR 008M030/21 Reflector bracket lateral

**Z-FTDF 005**

- Fastening method self-adhesive
- For pocket-size edge sensor *PosCon*

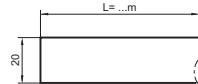

**order reference**

Z-FTDF 005I0100 Reflective tape rectangular 5 x 100 mm

Z-FTDF 005I0500 Reflective tape rectangular 5 x 500 mm

Z-FTDF 005I1000 Reflective tape rectangular 5 x 1000 mm

Z-FTDF 005I1600 Reflective tape rectangular 5 x 1600 mm

**Z-FTDF 020**

- Fastening method self-adhesive
- For pocket-size edge sensor *PosCon*

**order reference**

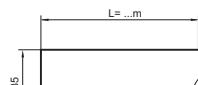

Z-FTDF 020I0100 Reflective tape rectangular 20 x 100 mm

Z-FTDF 020I0180 Reflective tape rectangular 20 x 180 mm

Z-FTDF 020I0500 Reflective tape rectangular 20 x 500 mm

Z-FTDF 020I1000 Reflective tape rectangular 20 x 1000 mm

Z-FTDF 020I1600 Reflective tape rectangular 20 x 1600 mm

**Z-FTDF 035**

- Fastening method self-adhesive
- For pocket-size edge sensor *PosCon*

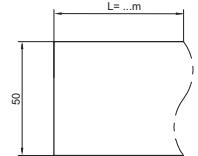

**order reference**

Z-FTDF 035I0100 Reflective tape rectangular 35 x 100 mm

Z-FTDF 035I0500 Reflective tape rectangular 35 x 500 mm

Z-FTDF 035I1000 Reflective tape rectangular 35 x 1000 mm

Z-FTDF 035I1600 Reflective tape rectangular 35 x 1600 mm

**Z-FTDF 050**

- Fastening method self-adhesive
- For pocket-size edge sensor *PosCon*

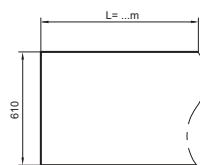

**order reference**

Z-FTDF 050I0100 Reflective tape rectangular 50 x 100 mm

Z-FTDF 050I0500 Reflective tape rectangular 50 x 500 mm

Z-FTDF 050I1000 Reflective tape rectangular 50 x 1000 mm

Z-FTDF 050I1600 Reflective tape rectangular 50 x 1600 mm

**Z-FTDF 610**

- Fastening method self-adhesive
- For pocket-size edge sensor *PosCon*

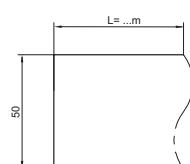

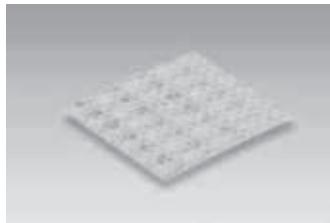

**order reference**

Z-FTDF 610I0100 Reflective tape rectangular 610 x 100 mm

Z-FTDF 610I0500 Reflective tape rectangular 610 x 500 mm

Z-FTDF 610I1000 Reflective tape rectangular 610 x 1000 mm

Z-FTDF 610I1600 Reflective tape rectangular 610 x 1600 mm

**Z-FTDF 050K**

- Fastening method self-adhesive
- For Retro-reflective sensors

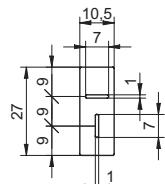

**order reference**

Z-FTDF 050K0100 Reflective type rectangular 50 x 100 mm

Z-FTDF 050K0500 Reflective type rectangular 50 x 500 mm

Z-FTDF 050K1000 Reflective type rectangular 50 x 1000 mm

Z-FTDF 050K9999 Reflective type rectangular 50 x 10000 mm

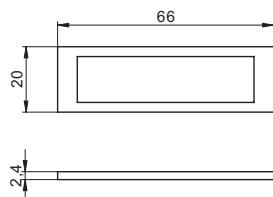

**Slot aperture stickers series 14**

- Material: Polyester foil
- Contents: 2 pieces
- self-adhesive

For use with FSDK 14 / FEDK 14

**order reference**

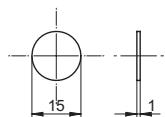

10144075 Slot aperture stickers series 14

**Protector cap for Oxdm 20**

- Material: PMMA
- Self-adhesive

**order reference**

10156878 Protector cap Oxdm 20

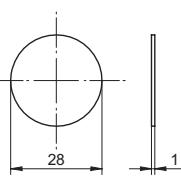

**Glass cover for sensors series 18**

- Material: glass

For use with cap nut series 18

**order reference**

10103068 Glass cover series 18

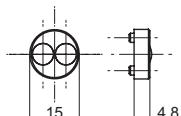

**Glass cover for sensors series 30**

- Material: glass

For use with cap nut series 30

**order reference**

10103226 Glass cover series 30

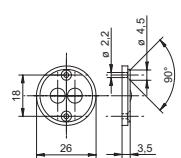

**Doubling lens for sensors serie 18**

- Material: PBTP / glass
- For double the sensing distance FZAM 18

For use with FZAM 18

**order reference**

10107250 Doubling lens series 18 FZAM 18

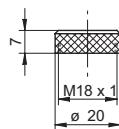

**Doubling lens for sensors serie 30**

- Material: PC / glass
- For double the sensing distance FZAM 30

For use with FZAM 30

**order reference**

10107408 Doubling lens series 30 FZAM 30

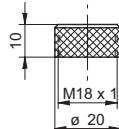

**Cap nut for photoelectric sensors series 18**

- Material: Nickel-plated brass

For use with FZAM 18 (with glass cover)

**order reference**

10103067 Cap nut glass cover for sensors series 18

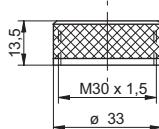

**Cap nut for photoelectric sensors series 18**

- Material: Nickel-plated brass

For use with FZAM 18 (with doubling lens)

**order reference**

10115913 Cap nut glass cover and doubling lens for sensors series 18

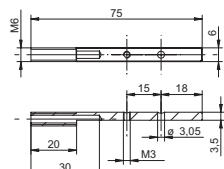

**Cap nut for photoelectric sensors series 30**

- Material: Nickel-plated brass

For use with FZAM 30 (with glass cover)

**order reference**

10102801 Cap nut glass cover for sensors series 30

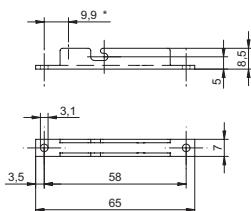

**Mounting brad FHDK 04**

- Material: Nickel-plated steel

For use with FHDK 04

**order reference**

10163196 Mounting brad FHDK 04

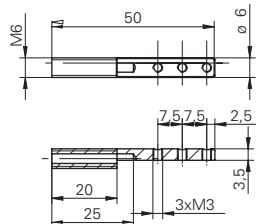

**Bracket for profiles sensor series 04**

- Material: Aluminum

For use with FHDK 04

**order reference**

10163299 Bracket for profiles FHDK 04

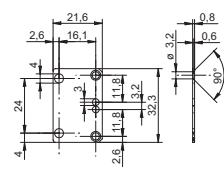

**Minofix-Mounting kit for MINOS**

- Material: brass nickel-plated

For use with FxxK 07 (MINOS)

**order reference**

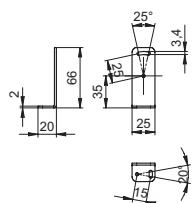

10150844 Minofix mounting 07

**Mounting panel for sensors series 10**

For use with UxDK 10, FxDK 10, OxDK 10

**order reference**

10162083 Mounting panel for sensors series 10

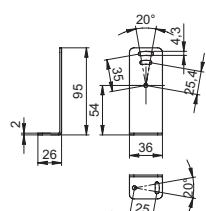

**Mounting bracket for sensors O300 (L design)**

- Material: Steel

For use with O300

**order reference**

11102423 Mounting bracket O300 (L design)

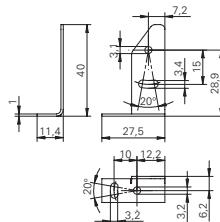

**Mounting bracket for sensors O500/U500 (L design)**

- Material: Steel

For use with O500

**order reference**

11092246 Mounting bracket O500/U500 (L design)

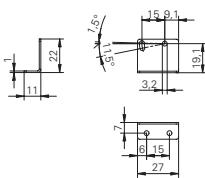

**Mounting bracket for sensors series 10**

- Material: Steel

For use with UxDK 10, FxDK 10, OxDK 10

**order reference**

10118798 Mounting bracket series 10

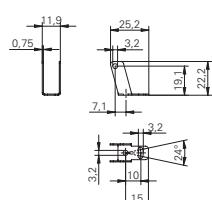

**Mounting bracket for sensors series 10 (L design)**

- Material: Steel

For use with UxDK 10, FxDK 10, OxDK 10

**order reference**

10133792 Mounting bracket series 10 (L design)

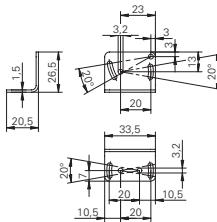

**Mounting bracket for sensors series 10 (U design)**

- Material: Steel

For use with UxDK 10, FxDK 10, OxDK 10 (only cable versions)

**order reference**

10114501 Mounting bracket series 10 (U design)

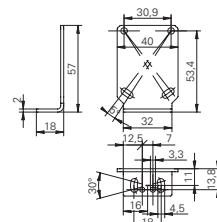

**Mounting bracket for sensors series 12**

- Material: Steel

For use with FxDM 12, OxDM 12

**order reference**

10113873 Mounting bracket series 12 (L design)

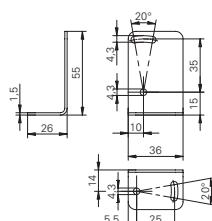

**Mounting bracket for sensors series 13**

- Material: Steel

For use with OxDM 13

**order reference**

10161695 Mounting bracket for sensors series 13 (L design)

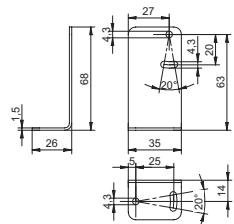

**Mounting bracket for sensors series 14**

- Material: Steel

For use with FxDK 14, OxDK 14

**order reference**

10134964 Mounting bracket series 14 (L design)

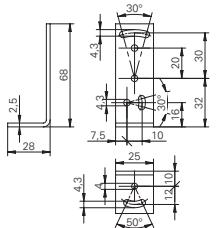

**Mounting bracket for washdown sensors series 14**

- Material: Stainless Steel

For use with FxDR 14

**order reference**

11046278 Mounting bracket series 14 washdown

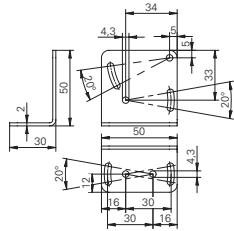

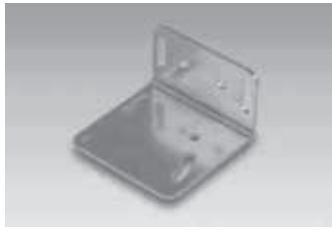

**Mounting bracket for sensors series 15**

- Material: Steel

For use with FxDM 15

**order reference**

10103415 Mounting bracket series 15 (L design)

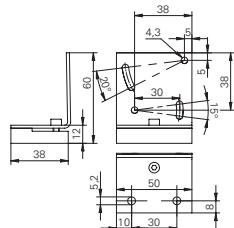

**Mounting bracket for sensors series 16**

- Material: Steel

For use with FxDM 16, OxDM 16

**order reference**

10113917 Mounting bracket series 16 (L design)

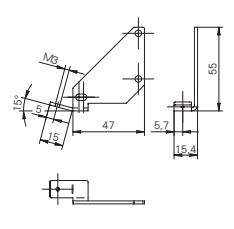

**Mounting bracket for fine adjustment series 16**

- Material: Steel

Simplifies the alignment of the laser sensors series OSDM 16 / OEMD 16

**order reference**

10119373 Mounting bracket for fine adjustment series 16

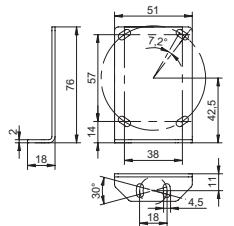

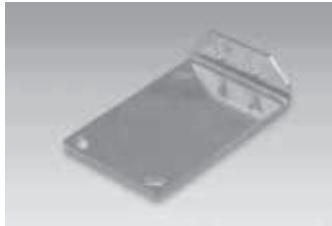

**Lens cleaning air nozzle bracket**

- Material: Steel

For use with FxDM 16, OxDM 16

**order reference**

10116407 Lens cleaning air nozzle bracket

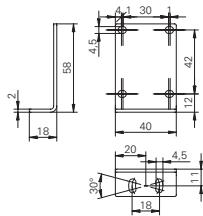

**Mounting bracket for sensor OxDM 20**

- Material: Steel

For use with OADM 20, OADM 250

**order reference**

11010227 Mounting bracket OxDM 20

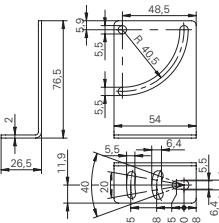

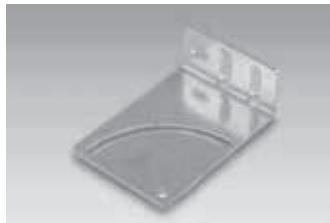

**Mounting bracket for Logipal/PosCon**

- Material: Steel

For use with ZADM 023, FKDM 22

**order reference**

10126220 Mounting bracket series 22 L design

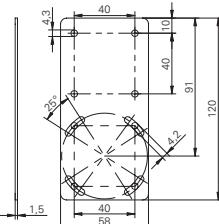

**Mounting bracket for sensors series 26**

- Material: Steel

For use with FxDK 26

**order reference**

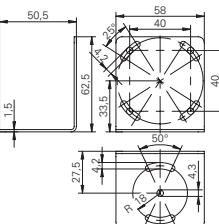

10112477 Mounting bracket series 26 (L design)

**Mounting bracket for Verisens**

- Material: Steel

**order reference**

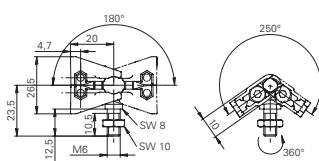

10159905 Mounting bracket for Verisens

**Mounting bracket for Verisens (L design)**

- Material: Steel

**order reference**

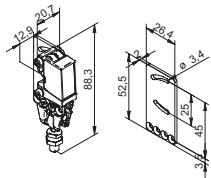

10159906 Mounting bracket for Verisens (L design)

**Sensofix-Base module**

- Clamps made of stainless steel
- Ball pivots made of galvanized steel

**order reference**

10149010 Sensofix-Base module

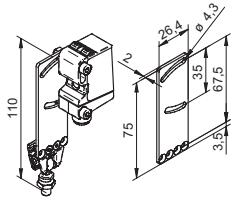

**Sensofix-Mounting kit for sensors O300**

- Clamps made of stainless steel
- Ball pivots made of galvanized steel
- Mounting panel made of stainless steel

For use with photoelectric sensors O300

**order reference**

11104963 Sensofix O300

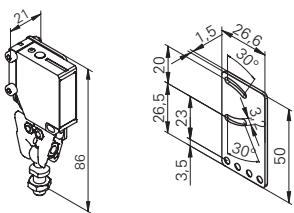

**Sensofix-Mounting kit for sensors O500/U500**

- Clamps made of stainless steel
- Ball pivots made of galvanized steel
- Mounting panel made of stainless steel

For use with photoelectric sensors O500

**order reference**

11099942 Sensofix O500/U500

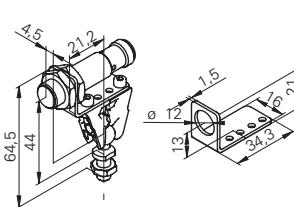

**Sensofix-Mounting kit for sensors series 12**

- Clamps made of stainless steel
- Ball pivots made of galvanized steel
- Mounting panel made of stainless steel

For use with FxDM 12, OxDM 12

**order reference**

10150328 Sensofix series 12

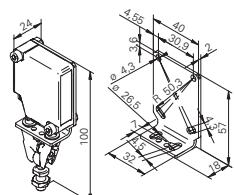

**Sensofix-Mounting kit for sensors series 12 round**

- Clamps made of stainless steel
- Ball pivots made of galvanized steel
- Mounting panel made of stainless steel

For use with all sensors in M12 housing

**order reference**

10151720 Sensofix series 12 round

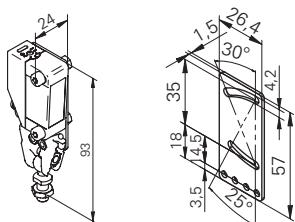

**Sensofix-Mounting kit for sensors series 13**

- Clamps made of stainless steel
- Ball pivots made of galvanized steel
- Mounting panel made of stainless steel

For use with OADM 13

**order reference**

10161829 Sensofix series 13

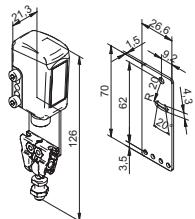

**Sensofix-Mounting kit for sensors series 14**

- Clamps made of stainless steel
- Ball pivots made of galvanized steel
- Mounting panel made of stainless steel

For use with FxDK 14, OxDK 14

**order reference**

10149011 Sensofix series 14

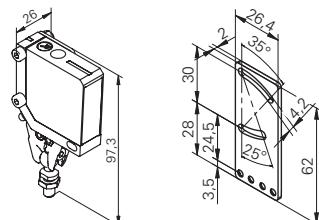

**Sensofix-Mounting kit for washdown sensors series 14**

- Clamps made of stainless steel
- Ball pivots made of galvanized steel
- Mounting panel made of stainless steel

For use with FxDR 14

**order reference**

11046279 Sensofix series 14 washdown

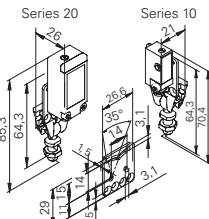

**Sensofix-Mounting kit for sensors series 16**

- Mounting panel made of stainless steel
- Clamps made of stainless steel
- Ball pivots made of galvanized steel

For use with FxDM 16, Oxdm 16

**order reference**

10151721 Sensofix series 16

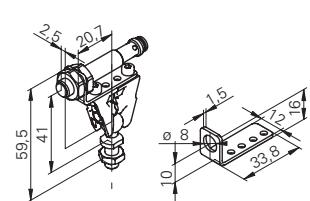

**Sensofix-Mounting kit for sensors series 10/20**

- Clamps made of stainless steel
- Ball pivots made of galvanized steel
- Mounting panel made of stainless steel

For use with photoelectric and ultrasonic sensors series 10, series 20

**order reference**

10150326 Sensofix series 10 / series 20

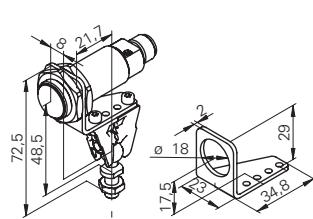

**Sensofix-Mounting kit for sensors series 08 round**

- Clamps made of stainless steel
- Ball pivots made of galvanized steel
- Mounting panel made of stainless steel

For use with all sensors in M8 housing

**order reference**

10151719 Sensofix series 08 round

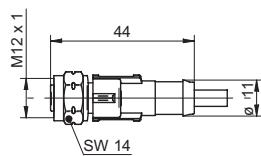

**Sensofix-Mounting kit for sensors series 18 round**

- Clamps made of stainless steel
- Ball pivots made of galvanized steel
- Mounting panel made of stainless steel

For use with all sensors in M18 housing

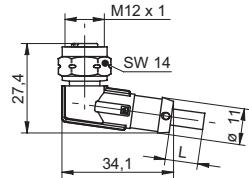

**order reference**

10151658 Sensofix series 18

**ESG 34F** - Connector M12 straight, PVC/V4A**order reference**

|              |                                               |
|--------------|-----------------------------------------------|
| ESG 34AF0500 | Connector M12, 4 pin, straight, 5 m, V4A-PVC  |
| ESG 34AF1000 | Connector M12, 4 pin, straight, 10 m, V4A-PVC |

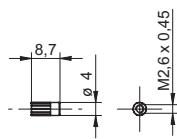

- Connector unshielded
- 4 pin version
- Cable coating PVC
- Cap nut material in stainless steel V4A
- Ecolab certified and FDA conform
- UL listed, number E315836

**ESW 33F** - Connector M12 angular, PVC/V4A**order reference**

|              |                                              |
|--------------|----------------------------------------------|
| ESW 33AF0200 | Connector M12, 4 pin, angular, 2 m, V4A-PVC  |
| ESW 33AF0500 | Connector M12, 4 pin, angular, 5 m, V4A-PVC  |
| ESW 33AF1000 | Connector M12, 4 pin, angular, 10 m, V4A-PVC |
| ESW 33AF2500 | Connector M12, 4 pin, angular, 25 m, V4A-PVC |

- Connector unshielded
- 4 pin version
- Cable coating PVC
- Cap nut material in stainless steel V4A
- Ecolab certified and FDA conform
- UL listed, number E315836

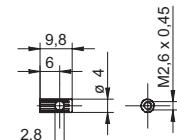

**Doubling lens M2,6**

- Increases the actual range S<sub>b</sub> by a factor of 6
- Contents: 2 pieces

For fiber optic: FSE 200C1Y00 / FSE 200C2Y00, FSA 200C1Y00, FSG 200C1Y00, FSE 200E1Y00

**order reference**

10134541 Doubling lens increases the actual range (paire)

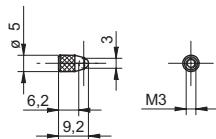

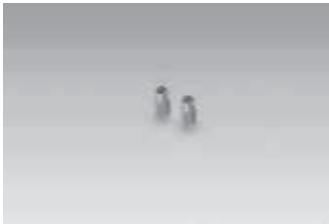

**Doubling lens M2,6 (side view version)**

- Side view version
- Increases the actual range S<sub>b</sub> by a factor of 6
- Contents: 2 pieces

For fiber optic: FSE 200C1Y00 / FSE 200C2Y00, FSA 200C1Y00, FSG 200C1Y00, FSE 200E1Y00

**order reference**

10134540 Doubling lens increases the actual range (paire)

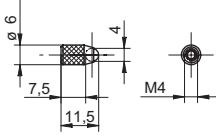

**Doubling lens M3**

- Material: brass / glass
- Increases the actual range S<sub>b</sub> by a factor of 6
- Contents: 2 pieces

For fiber optic: FSE 200C1004

**order reference**

10119910 Doubling lens M3 increases the actual range (paire)

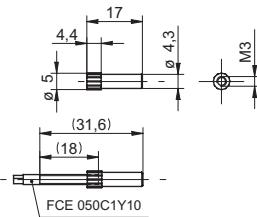

**Doubling lens M4**

- Material: brass / glass
- Increases the actual range S<sub>b</sub> by a factor of 6
- Contents: 2 pieces

For fiber optic: FSE 200C1004

**order reference**

10119909 Doubling lens M4 increases the actual range (paire)

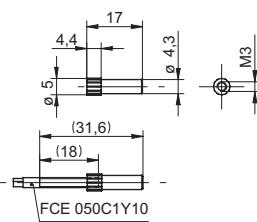

**Focusing lens M3 ø 0,1 mm**

- Light spot Ø 0,1 mm at a distance of 4,6 mm

For fiber optic: FCE 050C1Y10 (empfohlen), FCE 200D1Y00, FCE 200D1Y01, FCE 200E1Y00

**order reference**

10134544 Focusing lens M3 ø 0,1 mm

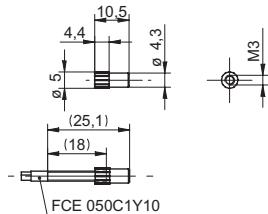

**Focusing lens M3 ø 0,4 m**

- Light spot Ø 0,4 mm at a distance of 7 mm

For fiber optic: FCE 050C1Y10 (empfohlen), FCE 200D1Y00, FCE 200D1Y01, FCE 200E1Y00

**order reference**

10134543 Focusing lens M3 ø 0,4 m

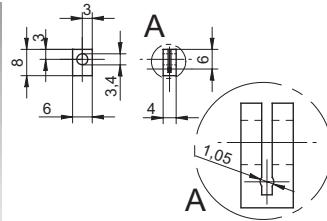

**Focusing lens M3 ø 2 mm**

- Light spot Ø 2 mm at a distance of 19 mm

For fiber optic: FCE 050C1Y10 (empfohlen), FCE 200D1Y00, FCE 200D1Y01, FCE 200E1Y00

**order reference**

10134542 Focusing lens M3 ø 2 mm

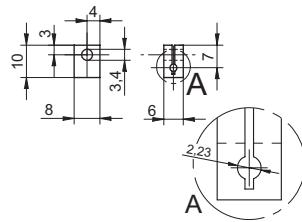

**Mounting bracket 1,1 mm**

- Material: Aluminum

For fiber optic through beam type with 1,1 mm sheath diameters

**order reference**

10119912 Mounting bracket Ø 1,1 mm

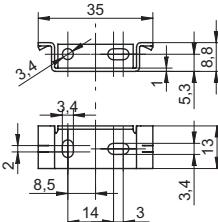

**Mounting bracket 2,2 mm**

- Material: Aluminum

For fiber optic through beam type with 2,2 mm sheath diameters

**order reference**

10119911 Mounting bracket Ø 2,2 mm

**Mounting bracket for fiber optic sensors series 12**

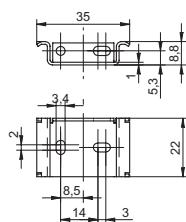

- Material: Steel

- Delivered with every plastic fiber optic sensor series 12

For use with FVDK 12

**order reference**

10145702 Mounting bracket for fiber optic sensors series 12

**Mounting bracket for fiber optic sensors series 22**

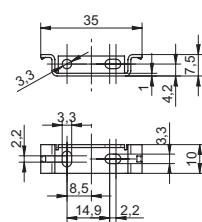

- Material: Steel

- Delivered with every plastic fiber optic sensor series 22

For use with FVDK 22

**order reference**

10125534 Mounting bracket for fiber optic sensors series 22

**Mounting bracket for fiber optic sensors series 60**

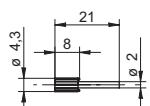

- Material: Steel

- Must be ordered separately for series 66 and series 67 sensors

For use with FVDK 66, FVDK 67

**order reference**

10159806 Mounting bracket for fiber optic sensors series 60, 66, 67, 80

**Reduction tube**

- Set of 2
- Delivered with every 1 mm diameter plastic fiber optic

**order reference**

10140260 Reduction tube

**Fiber optic cable extension**

- Reduction in range due to fiber optic extension: 2 m = approx. 25%
- Reduction in range due to fiber optic extension: 5 m = approx. 60%

**order reference**

10145523 Fiber optic cable extension 5 m hochflexibel

10156738 Fiber optic cable extension 2 m

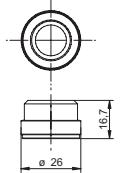

10158142 Fiber optic cable extension 5 m

**Cutting tool**

- Delivered with every plastic fiber optic

**order reference**

10114652 Cutting tool for plastic fiber optics

**Adapter for glass fiber optic sensors 30**

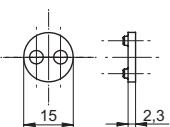

- Material: POM

For use with fiber optic amplifier FZAM 30

**order reference**

10102757 Adapter series 30

10106042 Adapter series 30 (angled fiber optics)

**Adjusting plate for glass fiber optic sensors 18 (replace)**

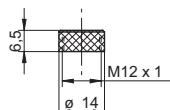

- Material: PETP

- For re-orders when lost

- Enclosed with every glass fiber optic of type A

**order reference**

10101958 Adjusting plate series 18

**Cap nut for glass fiber optic sensors 15 (replace)**

- Material: Nickel-plated brass

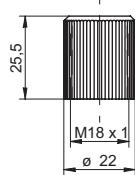

- For re-orders when lost

- Enclosed with every glass fiber optic of type B

For use with FVDM 15

**order reference**

10103230 Cap nut (replace) for fiber optics series 15

**Cap nut for glass fiber optic sensors 18 (replace)**

- Material: POM
- For re-orders when lost
- Enclosed with every glass fiber optic of type A

For use with FZAM 18

**order reference**

10101480 Cap nut (replace) for fiber optics series 18

## Active zone

The zone in which an object can be detected in front of the sensor. With diffuse sensors, this is approximately equivalent to the zone within the maximum sensing distance where the emitted beam and the reception angle intersect. With retro-reflective sensors, this is the zone from the emitted beam exit plane to the reflector and from there back to the receiver entrance plane. With through beam sensors, this is the zone from the emitted beam exit plane to the receiver entrance plane.

## Actual range S<sub>b</sub>

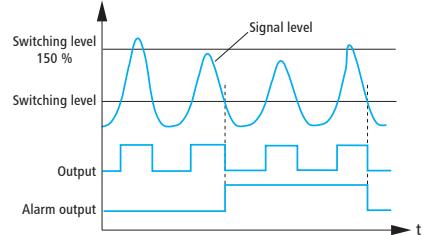

Like the nominal range S<sub>n</sub>, but including an excess gain of 50% excess gain, i.e. the maximum distance at which reliable operation of the sensor is possible

## Adjustment aid

See «Output indicator»

## Alarm output

Output function which indicates an inadequate signal level. The alarm output usually has a «dynamic» function which indicates whether the excess gain of 150% of the switching threshold was exceeded or not during the last light switching operation. It is also usually available as a «static» function: in this case, the alarm output indicates whether the current value of the signal is within the «critical range» between 100% and 150% of the switching threshold.

## Ambient light immunity

Maximum permissible light intensity of the ambient light measured with a non-pulsed light source to IEC60947-5-2 and directed together with the receiver at a white reference paper which clearly covers the received beam. The light intensity is measured on the reference paper. In almost all sensor ranges, direct exposure of the white object to sunlight has no effect on the measurement. However, direct exposure of the received beam to sunlight almost certainly causes measuring errors.

## Analog output

In contrast to the binary output with two possible output states, the analog output allows one continuous value such as a voltage or current to be emitted, resulting in a higher resolution of the measured values (see «Resolution»). Usually available as a voltage output 0 ... 10 V and current output 0 ... 20 mA or 4 ... 20 mA. The analog value can also be transmitted via a digital interface like RS 485.

## Background suppression

Diffuse sensors usually operate by the triangulation principle. Thanks to this accurate distance measurement, a background may be located close behind the adjusted switching point without interfering with the measurement. The background is «suppressed».

## Beam alignment, squint

Due to the addition of the production tolerances of the optical and mechanical components which cannot be compensated by adjustment during manufacture, a squint between the emitter and receiver beams of up to several degrees can occur. From a light distance of more than approx. 40 cm, retro-reflective sensors must usually be aligned. (Exception: OAx/OBx range is factory-adjusted.)

## Beam-interrupting

Sensor class in which the presence of an object is detected by interruption of the light beam between an emitter (and possibly a reflector) and an associated receiver.

## Binary output

Output which can assume two states, i.e. a switching output

## Black-white (gray-white) offset

For diffuse sensors with foreground and background suppression, there is a reduction in the sensing distance on gray or black reference paper in comparison with white reference paper (foreground suppression: increased sensing distance). This is also known as the black-white and gray-white offset. The sensing distance diagram shows the reduction in the sensing distance to gray or black as a function of the adjusted sensing distance.

## Blind region

Because the emitter and receiver axes are usually offset to each other, it is possible at very close distances to the object that no light emitted by the emitted beam is within the detected angle of the receiver. In this situation, the sensor is dark-switched, or «blind».

## CE conformity

Designates compliance of the products with European Union directives. The CE marking of the products is conditional on metrological proof of their electromagnetic compatibility (EMC) according to IEC 61000-4-x standards. Please also note the information on the safety concept.

## Closing delay

Output function which extends the dark-switched state of a binary sensor by a specific time. This causes a delay in the switching of a light-switching output and the dark-switching output switches later.

## Color sensor *LOGIPAL*

A color sensor determines the magnitude of deviation of the color components between a taught-in color and the color reflected by the object. The switching output indicates whether at least one color component is outside the specified tolerance bands.

## Color-based

Sensor class which detects a specific composition of the reflected light spectrum, meaning colors or gray scales (=contrasts). The distance and received light intensity are secondary.

## Complementary output

Depending on the wiring the output can be used as a light-switching or dark-switching output. Both output versions are available simultaneously.

## Correction factor

The material and the surface texture of the object affect the switching distance of a diffuse sensor with intensity difference. To determine the corrected switching distance, the following values must therefore be applied to the relative receiving signal (KFs) and as an approximation to the distance (KFd).

| Material               | KFs  | KFd  |
|------------------------|------|------|
| Kodak test card        | 100% | 100% |
| Light, planed wood 80% | 90%  |      |
| Rough wood             | 20%  | 45%  |
| Drawn aluminum         | 25%  | 50%  |
| Cardboard, matt black  | 7%   | 26%  |

## Current consumption

Because photoelectric sensors usually operate with pulsed light, their operating current is not constant, but assumes a saw-tooth shape due to the internal smoothing of the current. An average value and a maximum value can be specified from this. Usually this is the maximum value.

# Glossary

Degree of remission

The degree of remission designates the diffuse proportion of the reflected light, i.e. without the reflective proportion.

Diffuse sensor

Diffuse sensors detect the presence of an object by illuminating it with emitted light, which is then reflected by the object to the receiver in a diffused form (remitted).

Direction of approach

With triangulation sensors, the approach of an object edge in the direction from the emitter lens to the receiver lens or the reverse can lead to incorrect results. The directions of approach from the front or the side cause no errors.

Distance-based

Sensor class in which the distance to the object is primarily assessed as the measured value. The intensity of the received signal, colors or gray scales are secondary.

ECOLAB approved

The sensors are resistant to many common cleaning agents.

EHEDG (Hygienic Design)

Sensors and mounting accessories meet the design criteria for hygienic applications. These sensors can be used in close proximity to foodstuff and facilitate the certification of the machine.

EMC

All sensors undergo type testing with regard to their electromagnetic compatibility (EMC) according to the standards IEC61000-4-2, -3, -4.

Error correction

Photoelectric sensors usually operate by measuring pulsed light reflected by the object to the receiver. Because a measurement of this kind can be interfered with by various effects from the surroundings, e.g. rapid changes in the ambient light (switching fluorescent lighting on and off, welding sparks etc.), not all received light pulses appear in their correct magnitude, which could lead to switching errors. Fault correction evaluates the received pulses and only changes the switching state when a significant majority of pulses received within a time window indicate the need to change the switching state.

Excess gain

Because signal losses can occur in applications with optical sensors due to soiling of the optics and ageing of the light source, an excess gain must be allowed in the design of the application by presuming a shorter distance to the object than that indicated by the switching point. For reliable operation, an excess gain of at least 150% of the switching threshold is required. This distance correction can either be read off from the excess gain diagram or by exploiting the point at which the output indicator stops flashing. There are corresponding correction factors for diffuse sensors with intensity difference.

External teach-in input

See «Teach-in»

FDA compliant

Consistent use of food compliant materials only.

Fiber optic sensor

An intensity-based sensor in which the emitter and receiver optics are replaced by an optical fiber connection.

# Glossary

## Focusing

Particularly for sensors operating by the triangulation principle, it is ideal when the size of the light spot is as small as possible. However, according to the laws of optics, it is only possible to bundle the light rays at one point of the light path, the so-called point of focus. For this reason, light sources are focused at a specific distance. This distance is optimum for the detection of very small objects.

## Infrared light

Light in a long-wave range which is invisible to the human eye. In comparison with red light LEDs, IR LEDs can supply a higher radiated power. Unsuitable for use with plastic optical fibers, but suitable for glass optical fibers.

## Intensity-based

Sensor class in which the light intensity impinging on the receiver is processed as a measured value (which is only an indirect measure of the distance to the object). The distance, colors or gray scales (= contrast) are secondary.

## Inverted output

Depending on the wiring the output can be used as a light-switching or dark-switching output. Both output variants exist at the same time.

## IO-Link

This is a communication standard for point-to-point connections between a master (connecting module) and a slave (sensor/actor). Non-screened standard sensor cables can be used as the transmission medium. Process data (analog/binary) and service data (parameters/diagnostics) can be transmitted by serial communication. IO-Link compatible sensors can be connected to existing I/O modules (without using serial communication). The advantage of IO-Link is the reduction in project planning and installation costs by a uniform interface and convenient parameter adjustment and management.

## Laser diode

Light source featuring an exit zone of the light that is very small and can therefore be focused by downstream optics to form a very small measuring point (light spot). Another feature is that the light intensity is regulated by a monitor function and therefore remains practically unchanged during the service life of the laser diode.

## Laser protection class

Lasers are subdivided into different protection classes according to their danger to the human eye:

|     |                                                                                                                                                                                                            |
|-----|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1:  | Harmless                                                                                                                                                                                                   |
| 1M: | Harmless as long as not further bundled by optical measures                                                                                                                                                |
| 2:  | Laser radiation exists only in the visible spectral range (400 ... 700 nm).<br>Harmless for short periods of irradiation (max. 0.25s, as normally given<br>by the natural protective reflex of the eyelid) |
| 2M: | Like 2 as long as not further bundled by optical measures                                                                                                                                                  |

## Light/dark operation

Light operation: the output switches when the receiver receives light.  
Dark operation: the output switches when the receiver receives no light.

## Linearity deviation

Deviation from a proportional linear function (straight line). This is specified as an absolute value in mm or as a relative value as a percentage of the far limit of the measuring range.

# Glossary

Linking capability of outputs

**Parallel connection of the outputs (OR function)**

Sensors with identical output stages (NPN or PNP) can be connected in parallel if they are connected to the same power supply unit. The number of sensors which can be connected in parallel depends on the respective load current and the currents flowing through the internal pull-up and pull-down resistors (typically 3 mA). The sum of all load currents plus the sum of all internal currents must not exceed the specified maximum switching current of a single sensor.

**Series connection of sensors (AND function)**

Relay outputs may be connected in series. For sensors with electronic outputs, it is not permissible to switch on the supply of one sensor via the output of a preceding sensor and implement an AND function in this way. Because a sensor represents a high capacitive load, this would activate the short circuit protection.

Measuring range

The sensor supplies a valid measurement result within this range. The measuring range and the limits of the measuring range are adjustable in some sensors.

Minimum pulse length

Output function which forces a minimum length, e.g. 4 ms, for the two output states of a binary sensor, so that even a slow controller can detect such a state without difficulty. In contrast to release/response delay, an output state longer than the minimum impulse length is not extended.

Mounting distance

Distance between sensors (in diffuse sensors between the emitted light spots on the object) to prevent optical interference. Sensors with measures to reduce optical interference are not affected by this, but if the number of 3 is exceeded, the specified mounting distance for the next sensor but one is applicable.

Mounting instructions (MAL)

Some sensors are supplied with mounting instructions (MAL) which contain detailed notes on the connection and operation of the sensor

Nominal range Sn

The guaranteed maximum switching distance of retro-reflective sensors under ideal conditions (at +25° C, not soiled, sensors adjusted to each other).

NPN output

Binary open collector switching output with NPN transistor switching to 0 V. Consequently the load current flows from the switching output through the load resistance to +Vs. A suppressor diode is integrated and also an internal load resistor of approx. 10 ... 50 kOhm for measurement purposes.

Off delay

Output function which extends the light-switched state of a binary sensor by a specific time. As a result, the light-switched output drops out later and the dark-switched output is switched after a delay.

On delay

Output function which extends the dark-switched state of a binary sensor by a specific time. As a result the light-switching output switches after a delay and the dark-switching output will drop out later.

*OneBox Design*

*OneBox Design* stands for a new Baumer housing design. Baumer NextGen sensors feature the same dimensions, through holes and control elements for all sensor principles and technologies within the series.

One Inch Class

Compact sensor for one-inch mounting hole spacing is ideally suited for systems with extremely tight spaces..

# Glossary

Optical fiber

Cable made of glass or plastic fibers which conveys the light of a photoelectric sensor and enables the detection of an object at a constrained point due to its small size.

Optical interference

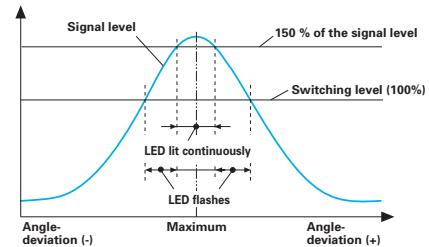

Without countermeasures, pulsed light sources which illuminate the same point on an object can overlap, which can cause switching errors. Sensors which are insensitive to optical interference use methods by which the pulses can evade each other and minimize situations in which switching errors are possible. These methods allow operation of up to 3 sensors in the same operating range, i.e. each sensor may «see» 2 interfering neighbors. The method becomes more reliable the better the neighboring sensors can be «seen», enabling the evasion algorithms to be suitably adjusted.

Output current

Maximum permissible current load at the outputs. Because the short-circuit protection secures all outputs together in sensors with several outputs and therefore monitors the sum of all output currents, it must be observed that the output current specification refers to this sum.

Output indicator

Visual display on the sensor, usually a yellow LED which indicates the status of the sensor receiver. LED off: receiving signal < switching threshold, LED flashing: receiving signal between 100 ... 150% of the switching threshold, LED steady on: receiving signal >150% of the switching threshold.

Ovvoltage protection

Protection against brief voltage surges in accordance with the standard IEC 61000-4

*ParCon/PosCon* line sensor

The line sensor is able to detect edges, widths and positions of objects without additional illumination. The measured value is issued with high accuracy as an analog value or via a serial interface.

PNP output

Binary open collector switching output with PNP transistor switching to +Vs. Consequently the load current flows from the switching output through the load resistance to 0 V. A suppressor diode is integrated and also an internal load resistor of approx. 10 ... 50 kOhm for measurement purposes.

Point source LED

Form of LED in which, in contrast to conventional LEDs, the light exit is not diffuse and distributed around the entire chip, but exits from the front in a circular and therefore clearly defined shape. A very small light spot can be created in this way (ideal for diffuse sensors with background suppression), similar to a laser, but at the expense of the total light intensity.

Polarization filter

Polarization filters only allow light to pass which is polarized in a specific plane. Retro-reflective sensors with polarization filters have polarization planes at the emitter and receiver twisted towards one another by 90°, so they only detect light which is reflected by a retro-reflector and depolarized in this way. For this reason, the light beam itself is always reliably interrupted by reflective objects (which leave the polarization plane unchanged).

## *proTect*<sup>⊕</sup>

Unique impermeability concept – it guarantees that the sensors comply with protection class IP 68/IP 69K standards even after many temperature cycles and therefore have a long service life and high reliability.

## Protection class (to IEC 60529)

**IP 65:** Protection against the penetration of dust and full protection against electrical contact. Protection against a water jet from any direction.

**IP 67:** Protection against the penetration of dust and full protection against electrical contact. Protection against water when the housing is immersed in water under specific pressure and time conditions.

## Pulsed light

The sensitivity of a photoelectric sensor to ambient light can substantially be reduced by using pulsed light. On the one hand, the emitter LEDs can emit a higher peak power in pulsed operation, on the other, this makes differential measurement possible during which the difference in the received light with the light source switched on or off can be evaluated and non-pulsed light can be effectively compensated.

## Push-pull output

Compared to the open collector output variants PNP (= load virtually 0V) and NPN (= load virtually +Vs), the push-pull output enables random switching of the load within the limits of the supply voltage. However, compared to the above named open collector output variants, it is not admissible to connect outputs in parallel.

## *qTarget*<sup>TM</sup>

The Baumer design aligns the sensor's light beam to the fixing holes. This will not only compensate tolerances between individual components but ensures consistent alignment accuracy within the complete sensor series.

## *qTeach*<sup>TM</sup>

With *qTeach* we are introducing a new, convenient and wear-free teach procedure. Teaching of O500 sensors is just by a touch with any ferromagnetic tool. A blue LED light provides clear optical feedback. To prevent user errors, *qTeach* locks autonomously after 5 minutes.

## Range sensor

Diffuse sensor with a switching output where two switching points can be set. This makes it possible to detect the presence of an object within a specified distance range.

## Red light

Standard light color in the visible range, also suitable for use with plastic optical fibers. Advantage: due to its visibility, this improves the adjustment and monitoring of the application.

## Reflection foil

See «(Retro-) reflector»

## Relative receiving signal

The relative receiving signal is specified in diffuse sensors operating by the intensity difference principle. This signal represents the signal level received from a white object as a function of the distance. With the aid of this diagram, it is possible to determine the sensing distance for an object which is not white. The correction factor of the respective material is required for this purpose.

## Release delay

Output function which extends the light-switched state of a binary sensor by a specific time. The light-switched output thereby opens later and the dark-switched output is switched after a delay.

## Glossary

|                                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Release time                      | The minimum time required for an object to have left the scanning range to cause a change in the output state. This change in state is immediate, unless a signal processing time is also specified by which this change in state is further delayed. Compliance with this release time is conditional on the switching threshold falling by max. 50%. If it is necessary for the sensor to take measures to reduce interference with other sensors, this time may be extended by up to 50 µs.                             |
| Reproducibility (Repeat accuracy) | Max. deviation between two measurements under identical conditions (object position, soiling, temperature, duty cycle)                                                                                                                                                                                                                                                                                                                                                                                                     |
| Residual ripple                   | Maximum proportion of alternating current which may be superimposed on the DC voltage supply with the momentary values remaining within the specified voltage supply range. Specified as a percentage of the mean value of +Vs.                                                                                                                                                                                                                                                                                            |
| Resolution                        | The smallest possible change in the measured value to cause a discernible change in the output signal.                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Response time                     | The minimum time required for an object to be within the sensing distance to cause a change in the output state. This change in state is immediate, unless a signal processing time is also specified by which this change in state is further delayed. Compliance with this response time is conditional on an excess gain of at least 50% (the output indicator does not flash). If it is necessary for the sensor to take measures to reduce interference with other sensors, this time may be extended by up to 50 µs. |
| (Retro-) reflector                | Reflector that casts light back in the direction of incidence and as a result, in contrast to a mirror, requires no exact alignment. They are available in the form of a triple reflector or reflective film.                                                                                                                                                                                                                                                                                                              |
| Reverse polarity protection       | Protection against reverse polarity is generally ensured between any connections of the sensor unless otherwise specified (e.g. only supply connections).                                                                                                                                                                                                                                                                                                                                                                  |
| Safety concept                    | The safety concept defines the technical, instructional and legal measures which ensure the user (machine manufacturer, owner, user) a high degree of safety when handling our components. The safety concept also serves as the basis for the CE marking of our products and can be obtained in German, English or French.                                                                                                                                                                                                |
| Sensing range Tb                  | The sensing range Tb ranges between the adjusted sensing distance and the blind region. The blind region defines the range immediately in front of the sensor where an object cannot be reliably detected. The sensing distance is therefore the distance where an object (Kodak white) is reliably detected.                                                                                                                                                                                                              |
| Sensing distance Tw               | The sensing distance Tw is the maximum achievable distance of a diffuse sensor measured at +25° C on white paper (Kodak Card No. 1 527 795) size 200 x 200 mm. At a maximum sensing distance of under 400 mm, the reference paper size is 100 x 100 mm. The excess gain necessary for reliable operation under ideal conditions (50%) is already included. Sensors with adjusting aids indicate this point by a continuously lit reception indicator.                                                                      |
| Sensitivity adjustment            | Sensors operating with intensity difference or as retro-reflective sensors may have adjustable sensitivity. The sensitivity can then be adjusted to the application using a potentiometer or by teach-in.                                                                                                                                                                                                                                                                                                                  |

# Glossary

Sensor standard

The sensor standard IEC60947-5-2 forms the basis for all type tests on photoelectric sensors.

Shape-based

Sensor class which detects specific features of shape, e.g. edges, the height of newspaper copies, etc. The distance, received light intensity, colors or gray scales are secondary.

Short circuit protection

In optical sensors, short circuit protection is clocked (switches the output off for approx. 20 ms), self-resetting (attempts to switch the output again after the shut-off time has elapsed) and start-delayed (to handle capacitive loads of up to 50 nF occurring with longer cables).

Signal processing time

Delay between the detection of the future output state and its transmission to the output caused by signal processing. This has no effect on the maximum measurement frequency!

Smallest object

If the optical prerequisites for the detection of small objects are fulfilled, i.e. a sufficient signal difference exists, the following generally applies to the detection of moving objects with diffuse sensors: time in the scanning range > response time.

For retro-reflective sensors: time in the scanning range > release time.

The time in the scanning range  $t_e$  can be calculated by:

$t_e = \text{distance in the scanning range}/\text{object speed}$

SmartReflect light barriers

Light barriers without reflectors. See section on SmartReflect light barriers.

Soiled lens indicator

See «Output indicator»

Start pulse suppression

Start pulse suppression suppresses undefined states during the starting phase by disabling all outputs during the first 20 ms after the voltage supply was switched on.

Switching hysteresis

Switching hysteresis is employed to prevent the normal fluctuations of the measured value close to the switching points of binary outputs from producing uncertain switching states (oscillating) at the output. A higher switching threshold to switch on the sensor is adjusted than to switch it off, resulting in a difference between the distances for switching on and off.

Teach-in

Electronic teaching of an operating parameter (e.g. sensitivity adjustment) by pressing a button or via an external teach-in input. The «static teach-in» function is available as a standard feature. During teach-in the on position and off position are taught in and the sensor calculates the optimum switching point from this. The on position is always used as a normally open function and the off position always as a normally closed function. There is also a «dynamic teach-in» function, during which the maximum and minimum values of the results measured over a desired time are analyzed and an optimum switching threshold for this situation is automatically adjusted afterwards.

Teach-input external

See «Teach-in».

Temperature drift

In photoelectric sensors, the emitter light sources (apart from laser diodes), receiver elements and amplifiers are subject to certain thermal effects. This dependency of the measured values on the temperature is specified by the designation «temperature drift».

## Glossary

---

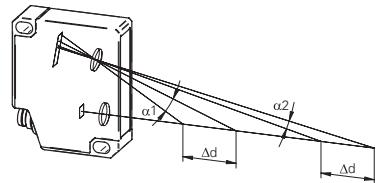

### Test input

Some sensors provide a means of switching off the emitter for a function test by activating an input. If the sensor was previously switched to light, the output of the sensor must consequentially change to the dark switching state

### Triangulation principle

Measuring principle used in diffuse sensors with background suppression and in distance-measuring sensors. The emitter, the object and the receiver form a triangular arrangement. The receiver is designed to enable measurement of the angle between the beams from the emitter to the object and from the object to the receiver. This angle depends on the distance to the object, which is determined by the position at which the received beam strikes the receiver element.

### UL test mark

The UL mark on a product indicates that samples of the complete product were tested by UL according to nationally acknowledged safety standards, that they are free from unacceptable, foreseeable risks such as fire, electric shocks and similar hazards and that the product was manufactured under UL supervision. Most products from Baumer electric are UL-listed. The file with the listed products can be viewed at HYPERLINK "<http://www.ul.com/database>".

### Voltage supply range

The voltage supply must be within a specified voltage supply range at all times to ensure the correct function of the sensor.

# Baumer – the strong partner.

We at Baumer are close to our customers, understand their needs and provide the best solution. Worldwide customer service for Baumer starts with on-the-spot personal discussions and qualified consultation. Our application engineers speak your language and strive from the start, through an interactive problem analysis, to offer comprehensive and user-compatible solutions.

## We are close to you across the globe.

The worldwide Baumer sales organizations guarantee short delivery times and readiness to supply. Many of our customers are directly linked via our electronic order system with the JIT logistics process.

A worldwide network coupled with the most modern communication techniques enable us to deliver information quickly and transparently to decision makers in all Baumer locations.

Closeness to the customer for Baumer means being available for your needs anywhere and at any time.

# Worldwide presence.

# Our overall portfolio

Baumer provides for every application the perfect solution.

## Presence detection

- Inductive sensors
- Photoelectric sensors
- Ultrasonic sensors
- Capacitive sensors
- Magnetic sensors
- Mechanical precision switches

## Distance measurement

- Inductive sensors
- Photoelectric sensors
- Ultrasonic sensors
- Bearingless linear encoders
- Cable-pull encoders

## Rotary encoders / Angle measurement

- Absolute encoders
- Incremental encoders
- HeavyDuty encoders
- Bearingless encoders
- Format alignment
- Inclination sensors

## Identification / Image processing

- Industrial Cameras
- Vision Sensors

## Process instrumentation

- Level measurement
- Temperature measurement
- Pressure measurement
- Conductivity measurement
- Force/strain sensors
- Counters
- Process displays
